Mapping a SharePoint Online environment in One Identity Manager

One Identity Manager offers simplified user administration for SharePoint Online environments. The One Identity Manager concentrates on the mapping of site collections, sites, and groups that exist within a cloud environment.

One Identity Manager provides company employees with the necessary user accounts. For this, you can use different mechanisms to connect employees to their user accounts. You can also manage user accounts independently of employees and therefore set up administrator user accounts.

The system information for the SharePoint Online structure is loaded into the One Identity Manager database during data synchronization. It is only possible to customize certain system information in One Identity Manager due to the complex dependencies and far reaching effects of changes.

For more detailed information about the SharePoint Online structure, see the SharePoint Online documentation from Microsoft.

Architecture overview

To access SharePoint Online organizational data, the SharePoint Online connector is installed on a synchronization server. The synchronization server ensures data is compared between the One Identity Manager database and SharePoint Online. The SharePoint Online connector is part of the SharePoint Online Module and responsible for communicating with the Microsoft Office 365 subscriptions of SharePoint Online in the cloud. The Microsoft CSOM (Client-side object model) is used for accessing the SharePoint Online data.

NOTE: For access to the data of a SharePoint Online tenant, the Azure Active Directory tenant to which the SharePoint Online tenant is connected must be synchronized.

For more detailed information about synchronizing an Azure Active Directory tenant, see the *One Identity Manager Administration Guide for Connecting to Azure Active Directory*.

Figure 1: Architecture for synchronization

One Identity Manager users for managing a SharePoint Online environment

The following users are used for setting up and administration of a SharePoint Online system.

Table 1: Users

| Users | Task |
|------------------------------|---|
| Target system administrators | Target system administrators must be assigned to the Target systems Administrators application role. |

| Users | Task |
|--|---|
| | <p>Users with this application role:</p> <ul style="list-style-type: none"> • Administrate application roles for individual target systems types. • Specify the target system manager. • Set up other application roles for target system managers if required. • Specify which application roles are conflicting for target system managers • Authorize other employee to be target system administrators. • Do not assume any administrative tasks within the target system. |
| <p>Target system managers</p> | <p>Target system managers must be assigned to Target systems SharePoint Online or a sub-application role.</p> <p>Users with this application role:</p> <ul style="list-style-type: none"> • Assume administrative tasks for the target system. • Create, change or delete target system objects, like user accounts or groups. • Edit password policies for the target system. • Prepare groups for adding to the IT Shop. • Can create employees with an identity that differs from the Primary identity. • Configure synchronization in the Synchronization Editor and defines the mapping for comparing target systems and One Identity Manager. • Edit the synchronization's target system types and outstanding objects. • Authorize other employees within their area of responsibility as target system managers and create child application roles if required. |
| <p>One Identity Manager administrators</p> | <ul style="list-style-type: none"> • Create customized permissions groups for application roles for role-based login to administration tools in Designer as required. • Create system users and permissions groups for non-role-based login to administration tools in Designer as required. • Enable or disable additional configuration parameters in |

Users**Task**

Designer as required.

- Create custom processes in Designer as required.
- Create and configures schedules as required.
- Create and configure password policies as required.

Configuration parameters

Use configuration parameters to configure the behavior of the system's basic settings. One Identity Manager provides default settings for different configuration parameters. Check the configuration parameters and modify them as necessary to suit your requirements.

Configuration parameters are defined in the One Identity Manager modules. Each One Identity Manager module can also install configuration parameters. You can find an overview of all configuration parameters in **Base data | General | Configuration parameters** in Designer.

For more information, see [Appendix: Configuration parameters for managing SharePoint Online](#) on page 130.

Synchronizing a SharePoint Online environment

One Identity Manager supports synchronization with SharePoint Online. One Identity Manager is responsible for synchronizing data between the SharePoint Online database and the One Identity Manager Service.

This sections explains:

- how to set up synchronization to import initial data from a SharePoint Online to the One Identity Manager database,
- how to adjust a synchronization configuration,
- how to start and deactivate the synchronization,
- how to evaluate the synchronization results.

TIP: Before you set up synchronization with a SharePoint Online, familiarize yourself with the Synchronization Editor. For detailed information about this tool, see the *One Identity Manager Target System Synchronization Reference Guide*.

Detailed information about this topic

- [Setting up the initial synchronization](#) on page 12
- [Customizing synchronization configuration](#)
- [SharePoint Online synchronization features](#)
- [Executing a synchronization](#) on page 30
- [Troubleshooting](#) on page 35
- [Appendix: Editing system objects](#) on page 133

Setting up the initial synchronization

The Synchronization Editor provides a project template that can be used to set up the synchronization of user accounts and permissions for the SharePoint Online environment.

You use these project templates to create synchronization projects with which you import the data from a SharePoint Online into your One Identity Manager database. In addition, the required processes are created that are used for the provisioning of changes to target system objects from the One Identity Manager database into the target system.

To load objects from a SharePoint Online environment into the One Identity Manager database for the first time

1. Prepare a user account in the Azure Active Directory tenant with sufficient permissions for synchronization. The Azure Active Directory tenant must be known in the One Identity Manager system.
2. The One Identity Manager components for managing SharePoint Online systems are available if the configuration parameter **TargetSystem | SharePointOnline** is set.
 - Check whether the configuration parameter is set in the Designer. Otherwise, set the configuration parameter and compile the database.
 - Other configuration parameters are installed when the module is installed. Check the configuration parameters and modify them as necessary to suit your requirements.
3. Install and configure a synchronization server and declare the server as Job server in One Identity Manager.
4. Create a synchronization project with the Synchronization Editor.

Detailed information about this topic

- [Users and Permissions for Synchronizing with SharePoint Online](#) on page 13
- [System requirements for the synchronization server](#) on page 15
- [Creating a synchronization project for initial synchronization of a SharePoint Online environment](#) on page 19
- [Appendix: Configuration parameters for managing SharePoint Online](#) on page 130
- [Appendix: Default project template for SharePoint Online](#)

Users and Permissions for Synchronizing with SharePoint Online

The following users are involved in synchronizing One Identity Manager with SharePoint Online.

Table 2: Users for synchronization

| Users | Permissions |
|--------------|---|
| User for | For full synchronization of SharePoint Online objects with the supplied |

| Users | Permissions |
|--|---|
| accessing SharePoint Online | <p>One Identity Manager default configuration, you must provide a user account with the minimum required permissions. The following is required:</p> <ul style="list-style-type: none"> An administrative user account of the associated Azure Active Directory organization <p>NOTE: This user account must be entered as the site collection administrator in all the site collections to be managed. You do this in SharePoint Online.</p> <p>For more detailed information about site collection administrators, see the Microsoft documentation.</p> <ul style="list-style-type: none"> Administrators for all site collections to be administrated <p>For more information, see How to prepare the synchronization user on page 15.</p> |
| One Identity Manager Service user account | <p>The user account for One Identity Manager Service requires rights to carry out operations at file level, for example, assigning user rights and creating and editing directories and files.</p> <p>The user account must belong to the Domain users group.</p> <p>The user account must have the Login as a service extended user right</p> <p>The user account requires access rights to the internal web service.</p> <p>i NOTE: If One Identity Manager Service runs under the network service (NT Authority\NetworkService), you can issue access rights for the internal web service with the following command line call:</p> <pre>netsh http add urlacl url=http://<IP address>:<port number>/ user="NT AUTHORITY\NETWORKSERVICE"</pre> <p>The user account needs full access to the One Identity Manager installation directory in order to automatically update One Identity Manager Service.</p> <p>In the default installation the One Identity Manager is installed under:</p> <ul style="list-style-type: none"> %ProgramFiles(x86)%\One Identity (on 32-bit operating systems) %ProgramFiles%\One Identity (on 64-bit operating systems) |
| User for accessing the One Identity Manager database | <p>The Synchronization default system user is provided for executing synchronization with an application server.</p> |

How to prepare the synchronization user

To provide a user with all required permissions for access to SharePoint Online, you must enter the user account for synchronization as administrator in all site collections to be synchronized. To enable this, an administrative user account of the corresponding Azure Active Directory organization must be determined.

During initial setup of the system connection for SharePoint Online synchronization with the Synchronization Editor, the synchronization user must be at least one of the following administrators:

- One of the administrators of the site collections to be administrated in SharePoint Online
- An Azure Active Directory organization administrator

When you initially set up the system connection for SharePoint Online synchronization using the Synchronization Editor, the synchronization user must be one of the administrators of the site collection to be managed in SharePoint Online or an Azure Active Directory organization administrator.

For information about how to determine the name of the Azure Active Directory organization and how to create a synchronization user using the Microsoft online portal, see the Azure Active Directory documentation from Microsoft.

Setting up the SharePoint Online synchronization server

All One Identity Manager Service actions are executed against the target system environment on the synchronization server. Data entries required for synchronization and administration with the One Identity Manager database are processed by the synchronization server.

The One Identity Manager Service with the SharePoint Online connector must be installed on the synchronization server.

Detailed information about this topic

- [System requirements for the synchronization server](#) on page 15
- [Installing the One Identity Manager Service](#) on page 16

System requirements for the synchronization server

To set up synchronization with a SharePoint Online environment, a server must be available on which the following software is installed:

- Windows operating system version 8.1. or later
 - Windows Server
- Following versions are supported:
- Windows Server 2012
 - Windows Server 2012 R2
 - Windows Server 2016
- Microsoft .NET Framework Version 4.7.2 or later

NOTE: Take the target system manufacturer's recommendations into account.

Installing the One Identity Manager Service

The One Identity Manager Service with the SharePoint Online connector must be installed on the synchronization server. The synchronization server must be known as a Job server in the One Identity Manager.

Table 3: Properties of the Job server

| Property | Value |
|-----------------|---|
| Server function | SharePoint Online connector |
| Machine role | Server Job server SharePoint Online |

NOTE: If several target system environments of the same type are synchronized under the same synchronization server, it is useful to set up a Job server for each target system on performance grounds. This avoids unnecessary swapping of connections to target systems because a Job server only has to process tasks of the same type (re-use of existing connections).

Use the Server Installer to install the One Identity Manager Service. The program executes the following steps:

- Setting up a Job server.
- Specifying machine roles and server function for the Job server.
- Remote installation of One Identity Manager Service components corresponding to the machine roles.
- Configuration of One Identity Manager Service.
- Starts the One Identity Manager Service.

NOTE: The program executes remote installation of the One Identity Manager Service. Local installation of the service is not possible with this program. Remote installation is only supported within a domain or a trusted domain.

For remote installation of One Identity Manager Service, you require an administrative workstation on which the One Identity Manager components are installed. For detailed information about installing a workstation, see the *One Identity Manager Installation Guide*.

To install and configure One Identity Manager Service remotely on a server

1. Start the program Server Installer on your administrative workstation.
2. Enter the valid connection credentials for the One Identity Manager database on the **Database connection** page.
3. Specify the server on which you want to install One Identity Manager Service on the **Server properties** page.
 - a. Select a Job server from the **Server** menu.
 - OR -
 - To create a new Job server, click **Add**.
 - b. Enter the following data for the Job server.

Table 4: Job Server Properties

| Property | Description |
|------------------|--|
| Server | Job server name. |
| Queue | Name of the queue to handle the process steps. Each One Identity Manager Service within the network must have a unique queue identifier. The process steps are requested by the job queue using exactly this queue name. The queue identifier is entered in the One Identity Manager Service configuration file. |
| Full server name | Full server name in accordance with DNS syntax. Example: <Name of servers>.<Fully qualified domain name> |

NOTE: You can use the **Extended** option to make changes to other properties for the Job server. You can also edit the properties later with Designer.

4. Select **SharePoint Online** on the **Machine roles** page.
5. Select **SharePoint Online connector** on the **Server functions** page.
6. Check the One Identity Manager Service configuration on the **Service settings** page.

NOTE: The initial service configuration is predefined already. If further changes need to be made to the configuration, you can do this later with the Designer. For detailed information about configuring the service, see the *One Identity Manager Configuration Guide*.

7. To configure remote installations, click **Next**.
8. Confirm the security prompt with **Yes**.
9. Select the directory with the install files on **Select installation source**.
10. Select the file with the private key on the page **Select private key file**.

NOTE: This page is only displayed when the database is encrypted.

11. Enter the service's installation data on the **Service access** page.

Table 5: Installation Data

| Data | Description |
|----------------------|--|
| Computer | <p>Server on which to install and start the service from.</p> <p>To select a server</p> <ul style="list-style-type: none"> • Enter a name for the server. - OR - • Select a entry from the list. |
| Service account | <p>User account data for the One Identity Manager Service.</p> <p>To enter a user account for the One Identity Manager Service</p> <ul style="list-style-type: none"> • Enter user account, password and password confirmation. |
| Installation account | <p>Data for the administrative user account to install the service.</p> <p>To enter an administrative user account for installation</p> <ul style="list-style-type: none"> • Enable Advanced. • Enable Current user. <p>This uses the user account of the current user.</p> <p>- OR -</p> <ul style="list-style-type: none"> • Enter user account, password and password confirmation. |

12. Click **Next** to start installing the service.
Installation of the service occurs automatically and may take some time.
13. Click **Finish** on the last page of Server Installer.

NOTE: The service is entered with the name **One Identity Manager Service** in the server service management.

Preparing a remote connection server for access to the SharePoint Online tenant

To configure synchronization with a target system, One Identity Manager must load the data from the target system. One Identity Manager communicates directly with target system to do this. Sometimes direct access from the workstation on which the Synchronization Editor is installed is not possible, because of the firewall configuration, for example, or because the workstation does not fulfill the necessary hardware and software requirements. If direct access to the workstation is not possible, you can set up a remote connection.

The remote connection server and the workstation must be in the same Active Directory domain.

Remote connection server configuration:

- One Identity Manager Service is started
- RemoteConnectPlugin is installed
- SharePoint Online connector is installed

The remote connection server must be declared as a Job server in One Identity Manager. The Job server name is required.

TIP: The remote connection server requires the same configuration as the synchronization server (with regard to the installed software and entitlements). Use the synchronization as remote connection server at the same time, by simply installing the RemoteConnectPlugin as well.

For more detailed information about setting up a remote connection, see the *One Identity Manager Target System Synchronization Reference Guide*.

Creating a synchronization project for initial synchronization of a SharePoint Online environment

Use Synchronization Editor to configure synchronization between the One Identity Manager database and SharePoint Online. The following describes the steps for initial configuration of a synchronization project.

After the initial configuration, you can customize and configure workflows within the synchronization project. Use the workflow wizard in the Synchronization Editor for this. The

Synchronization Editor also provides different configuration options for a synchronization project.

Information required for setting up a synchronization project

Have the following information available for setting up a synchronization project.

Table 6: Information Required for Setting up a Synchronization Project

| Data | Explanation |
|---|--|
| User account and password for logging in | User account and password for logging in to SharePoint Online. Example: <user name of the synchronization user>@yourorganization.onmicrosoft.com Make a user account available with sufficient permissions. For more information, see Users and Permissions for Synchronizing with SharePoint Online on page 13. |
| Synchronization server for SharePoint Online | All One Identity Manager Service actions are executed against the target system environment on the synchronization server. Data entries required for synchronization and administration with the One Identity Manager database are processed by the synchronization server. For more information, see Setting up the SharePoint Online synchronization server on page 15. |
| One Identity Manager database connection data | <ul style="list-style-type: none">• Database server• Database• SQL Server Login and password• Specifies whether integrated Windows authentication is used. This type of authentication is not recommended. If you decide to use it anyway, ensure that your environment supports Windows authentication. |
| Remote connection server | For more information, see Preparing a remote connection server for access to the SharePoint Online tenant on page 19. |

Creating an initial synchronization project for SharePoint Online

NOTE: The following sequence describes how you configure a synchronization project if Synchronization Editor is both:

- executed In default mode, and
- started from the launchpad

If you execute the project wizard in expert mode or directly from Synchronization Editor, additional configuration settings can be made. Follow the project wizard instructions through these steps.

To set up an initial synchronization project for a SharePoint Online tenant

1. Start the Launchpad and log on to the One Identity Manager database.
 - NOTE:** If synchronization is executed by an application server, connect the database through the application server.
2. Select **Target system type SharePoint Online** and click **Start**.
This starts the Synchronization Editor's project wizard.
3. Specify how One Identity Manager can access the target system on the **System access** page.
 - If access is possible from the workstation on which you started Synchronization Editor, you do not need to make any settings.
 - If access is not possible from the workstation on which you started Synchronization Editor, you can set up a remote connection.
Enable the **Connect using remote connection server** option and select the server to be used for the connection under **Job server**.
4. On the **Connection parameters** page, enter the login data for connecting to SharePoint Online.

Table 7: Connection parameters for the SharePoint Online

| Property | Description |
|--------------------------|--|
| Organization name | Name of the organization. |
| User name (user@-domain) | Fully qualified name (FQDN) of the user account for log on. Example: <user>@<domain.com> sync.user@yourorganization.onmicrosoft.com |

| Property | Description |
|----------|--|
| | The name of your organization is preset. |
| Password | Password for the user account. |

Click **Next**.

5. You can save the connection data on the last page of the system connection wizard.
 - Set the **Save connection locally** option to save the connection data. This can be reused when you set up other synchronization projects.
 - Click **Finish**, to end the system connection wizard and return to the project wizard.
6. On the **One Identity Manager Connection** tab, test the data for connecting to the One Identity Manager database. The data is loaded from the connected database. Reenter the password.

NOTE: If you use an unencrypted One Identity Manager database and have not yet saved any synchronization projects to the database, you need to enter all connection data again. This page is not shown if a synchronization project already exists.
7. The wizard loads the target system schema. This may take a few minutes depending on the type of target system access and the size of the target system.
8. On the **Restrict target system access** page, you specify how system access should work. You have the following options:

Table 8: Specify target system access

| Option | Meaning |
|--|--|
| Read-only access to target system. | <p>Specifies whether a synchronization workflow is only to be set up for the initial loading of the target system into the One Identity Manager database.</p> <p>The synchronization workflow has the following characteristics:</p> <ul style="list-style-type: none"> • Synchronization is in the direction of One Identity Manager. • Processing methods in the synchronization steps are only defined for synchronization in the direction of One Identity Manager |
| Read/write access to target system. Provisioning available. | <p>Specifies whether a provisioning workflow is to be set up in addition to the synchronization workflow for the initial loading of the target system.</p> <p>The provisioning workflow displays the following</p> |

| Option | Meaning |
|--------|---------|
|--------|---------|

characteristics:

- Synchronization is in the direction of the **Target system**.
- Processing methods are only defined in the synchronization steps for synchronization in the direction of the **Target system**.
- Synchronization steps are only created for such schema classes whose schema types have write access.

9. Select the synchronization server to execute synchronization on the **Synchronization server** page.

If the synchronization server is not declared as a Job server in the One Identity Manager database yet, you can add a new Job server.

- a. Click  to add a new Job server.
- b. Enter a name for the Job server and the full server name conforming to DNS syntax.
- c. Click **OK**.

The synchronization server is declared as Job server for the target system in the One Identity Manager database.

 **NOTE:** After you save the synchronization project, ensure that this server is set up as a synchronization server.

10. To close the project wizard, click **Finish**.

The synchronization project is created, saved and enabled immediately.

 **NOTE:** If you do not want the synchronization project to be activated immediately, disable the **Activate and save the new synchronization project automatically** option. In this case, save the synchronization project manually before closing the Synchronization Editor.

 **IMPORTANT:** The scope settings in synchronization projects for SharePoint Online must also be adjusted.

Configuring the synchronization log

All the information, tips, warnings, and errors that occur during synchronization are recorded in the synchronization log. You can configure the type of information to record separately for each system connection.

To configure the content of the synchronization log

1. To configure the synchronization log for target system connection, select the category **Configuration | Target system** in Synchronization Editor.
- OR -
To configure the synchronization log for the database connection, select **Configuration | One Identity Manager connection** in Synchronization Editor.
2. Select the **General** view and click **Configure**.
3. Select the **Synchronization log** view and set **Create synchronization log**.
4. Enable the data to be logged.

NOTE: Some content generates a particularly large volume of log data!
The synchronization log should only contain data required for error analysis and other analyses.

5. Click **OK**.

Synchronization logs are stored for a fixed length of time.

To modify the retention period for synchronization logs

- In Designer, enable the **DPR | Journal | LifeTime** configuration parameter and enter the maximum retention period.

Related Topics

- [Displaying synchronization results](#) on page 31

Customizing synchronization configuration

You have used the Synchronization Editor to set up a synchronization project for initial synchronization with SharePoint Online. You can use this synchronization project to load SharePoint Online site collections into the One Identity Manager database. If you manage sites, users and groups with One Identity Manager, the changes are provisioned to the SharePoint Online environment.

You must customize the synchronization configuration in order to compare the One Identity Manager database with the SharePoint Online regularly and to synchronize changes.

- To use One Identity Manager as the master system during synchronization, create a workflow with synchronization in the direction of the **Target system**.
- To specify which SharePoint Online objects and One Identity Manager database objects are included in the synchronization, edit the scope of the target system connection and the One Identity Manager database connection. To prevent data inconsistencies, define the same scope in both systems. If no scope is defined, all objects will be synchronized.
- You can use variables to create generally applicable synchronization configurations that contain the necessary information about the synchronization objects when synchronization starts. Variables can be implemented in base objects, schema classes, or processing methods, for example.
- Update the schema in the synchronization project if the One Identity Manager schema or target system schema has changed. Then you can add the changes to the mapping.
- To synchronize additional schema properties, update the schema in the synchronization project. Include the schema extensions in the mapping.
- Add your own schema types if you want to synchronize data, which does not have schema types in the connector schema. Include the schema extensions in the mapping.

For detailed information about configuring synchronization, see the *One Identity Manager Target System Synchronization Reference Guide*.

Detailed information about this topic

- [How to configure SharePoint Online synchronization](#) on page 25
- [Updating schemas](#) on page 26
- [SharePoint Online synchronization features](#)

How to configure SharePoint Online synchronization

The synchronization project for initial synchronization provides a workflow for initial loading of target system objects (initial synchronization) and one for provisioning object modifications from the One Identity Manager database to the target system (provisioning). To use One Identity Manager as the master system during synchronization, you also require a workflow with synchronization in the direction of the **Target system**.

To create a synchronization configuration for synchronizing SharePoint Online

1. Open the synchronization project in the Synchronization Editor.
2. Check whether existing mappings can be used for synchronizing the . Create new maps if required.

3. Create a new workflow with the workflow wizard.
Creates a workflow with **Target system** as its synchronization direction.
4. Create a new start up configuration. Use the new workflow to do this.
5. Save the changes.
6. Run a consistency check.

Updating schemas

All the schema data (schema types and schema properties) of the target system schema and the One Identity Manager schema are available when you are editing a synchronization project. Only a part of this data is really needed for configuring synchronization. If a synchronization project is finished, the schema is compressed to remove unnecessary data from the synchronization project. This can speed up loading the synchronization project. Deleted schema data can be added to the synchronization configuration again at a later point.

If the target system schema or the One Identity Manager schema has changed, these changes must also be added to the synchronization configuration. Then the changes can be added to the schema property mapping.

To include schema data that have been deleted through compressing and schema modifications in the synchronization project, update each schema in the synchronization project. This may be necessary if:

- A schema was changed by:
 - Changes to a target system schema
 - Customizations to the One Identity Manager schema
 - A One Identity Manager update migration
- A schema in the synchronization project was shrunk by:
 - enabling the synchronization project
 - saving the synchronization project for the first time
 - compressing a schema

To update a system connection schema

1. Select the category **Configuration | Target systems**.
- OR -
Select the category **Configuration | One Identity Manager connection**.
2. Select the view **General** and click **Update schema**.
3. Confirm the security prompt with **Yes**.
This reloads the schema data.

To edit a mapping

1. Select the category **Mappings**.
2. Select a mapping in the navigation view.
Opens the Mapping Editor. For more detailed information about mappings, see the *One Identity Manager Target System Synchronization Reference Guide*.

NOTE: The synchronization is deactivated if the schema of an activated synchronization project is updated. Reactivate the synchronization project to synchronize.

Configuring the provisioning of memberships

Memberships, for example, user accounts in groups, are saved in assignment tables in the One Identity Manager database. During provisioning of modified memberships, changes made in the target system will probably be overwritten. This behavior can occur under the following conditions:

- Memberships are saved in the target system as an object property in list form (Example: List of user accounts in the `Members` property of a SharePoint Onlinegroup).
- Memberships can be modified in either of the connected systems.
- A provisioning workflow and provisioning processes are set up.

If a membership in One Identity Manager changes, the complete list of members is transferred to the target system by default. Memberships, previously added to the target system are removed by this; previously deleted memberships are added again.

To prevent this, provisioning can be configured such that only the modified membership is provisioned in the target system. The corresponding behavior is configured separately for each assignment table.

To allow separate provisioning of memberships

1. In the Manager, select **SharePoint Online | Basic configuration data | Target system types**.
2. Select **SharePoint Online** in the result list.
3. Select **Configure tables for publishing**.
4. Select the assignment tables for which you want to allow separate provisioning. Multi-select is possible.
 - This option can only be enabled for assignment tables that have a base table with `XDateSubItem` or `CCC_XDateSubItem` column.
 - Assignment tables that are grouped together in a virtual schema property in the mapping must be marked identically.
5. Click **Enable merging**.
6. Save the changes.

For each assignment table labeled like this, the changes made in One Identity Manager are saved in a separate table. During modification provisioning, the members list in the target system is compared to the entries in this table. This means that only modified memberships are provisioned and the members list does not get entirely overwritten.

NOTE: The complete members list is updated by synchronization. During this process, objects with changes but incomplete provisioning are not handled. These objects are logged in the synchronization log.

For detailed information about provisioning memberships, see the *One Identity Manager Target System Synchronization Reference Guide*.

Configuring single object synchronization

Changes made to individual objects in the target system can be immediately applied in the One Identity Manager database without having to start a full synchronization of the target system environment. Individual objects can only be synchronized if the object is already present in the One Identity Manager database. The changes are applied to the mapped object properties. If a member list belongs to one of these properties, then the entries in the allocation table will also be updated. If the object is no longer present in the target system, then it is deleted from the One Identity Manager database.

Prerequisites

- A synchronization step exists that can import the changes to the changed object into One Identity Manager.
- The path to the base object of the synchronization is defined for the table that contains the changed object.

Single object synchronization is fully configured for synchronization projects created using the default project template. If you want to incorporate custom tables into this type of synchronization project, you must configure single object synchronization for these tables. For detailed information, see *One Identity Manager Target System Synchronization Reference Guide*.

To define the path to the base object for synchronization for a custom table

1. In the Manager, select **SharePoint Online | Basic configuration data | Target system types**.
2. In the result list, select the target system type **SharePoint Online**.
3. Select **Assign synchronization tables**.
4. In **Add assignments**, assign the custom table for which you want to use single object synchronization.
5. Save the changes.
6. Select **Configure tables for publishing**.

7. Select the custom table and enter the **Root object path**.

Enter the path to the base object in the ObjectWalker notation of the VI.DB.

Example: FK(UID_03STenant).XObjectKey

8. Save the changes.

SharePoint Online synchronization features

There are a number of features for synchronizing SharePoint Online environments, which are described here.

Multiple organizations are not supported

By default there is only one Azure Active Directory tenant per synchronization project. This tenant corresponds to the organization for logging in to Microsoft Office 365.

Target system schema

The target system schema in One Identity Manager cannot be extended.

Target system scope settings

After you have set up the synchronization project, you must adjust the setting for the target system scope in Synchronization Editor.

The scope should only include site collections in which the applicable synchronization user is entered in the SharePoint Online administration interface as the site collection administrator. There is no default user in SharePoint Online.

If the scope is not correctly set up, site collections cannot be loaded and synchronization is stopped.

To exclude site collections from the scope of a SharePoint Online synchronization project

1. Open the Synchronization Editor.
2. Select the category **Configuration | Target systems**.
3. Select the **Scope** view.
4. Click **Edit scope**. A list of site collections appears on the right-hand side.

5. In the list, select only the site collections for which the synchronization user is the same as the administrator in SharePoint Online.
6. Click **Commit to database** to save your changes.

Related Topics

- [Users and Permissions for Synchronizing with SharePoint Online](#) on page 13

Executing a synchronization

Synchronization is started using scheduled process plans. It is possible to start synchronization manually in the Synchronization Editor. You can simulate synchronization beforehand to estimate synchronization results and discover errors in the synchronization configuration. If synchronization was terminated unexpectedly, you must reset the start information to be able to restart synchronization.

Before you execute synchronization of the SharePoint Online environments, the Azure Active Directory environment in One Identity Manager must have the latest status.

i **NOTE:** Perform regular synchronizations of the Azure Active Directory environment. Synchronization must take place in the following order:

1. Azure Active Directory
2. SharePoint Online

Detailed information about this topic

- [Starting synchronizations](#) on page 30
- [Deactivating synchronization](#) on page 32
- [Displaying synchronization results](#) on page 31

Starting synchronizations

When setting up the initial synchronization project using the Launchpad, a default schedule for regular synchronizations is created and assigned. To execute regular synchronizations, activate this schedule.

To synchronize on a regular basis

1. Open the synchronization project in the Synchronization Editor.
2. Select the category **Configuration | Start up configurations**.
3. Select a start up configuration in the document view and click **Edit schedule**.
4. Edit the schedule properties.

5. To enable the schedule, click **Activate**.
6. Click **OK**.

You can also start synchronization manually if there is no active schedule.

To start initial synchronization manually

1. Open the synchronization project in the Synchronization Editor.
2. Select the category **Configuration | Start up configurations**.
3. Select a start up configuration in the document view and click **Execute**.
4. Confirm the security prompt with **Yes**.

- IMPORTANT:** As long as synchronization is running, you must not start another synchronization for the same target system. This applies especially, if the same synchronization objects would be processed.
- If another synchronization is started with the same start up configuration, this process is stop and is assigned the **Frozen** execution status. An error message is written to the One Identity Manager Service log file.
 - If another synchronization is started with another start up configuration, that addresses same target system, it may lead to synchronization error or loss of data. Specify One Identity Manager behavior in this case, in the start up configuration. Group start up configurations with the same start up behavior.

Displaying synchronization results

Synchronization results are summarized in the synchronization log. You can specify the extent of the synchronization log for each system connection individually. One Identity Manager provides several reports in which the synchronization results are organized under different criteria.

To display a synchronization log

1. Open the synchronization project in the Synchronization Editor.
2. Select **Logs**.
3. Click  in the navigation view toolbar.
Logs for all completed synchronization runs are displayed in the navigation view.
4. Select a log by double-clicking on it.
An analysis of the synchronization is shown as a report. You can save the report.

To display a provisioning log.

1. Open the synchronization project in the Synchronization Editor.
2. Select **Logs**.

3. Click  in the navigation view toolbar.

Logs for all completed provisioning processes are displayed in the navigation view.

4. Select a log by double-clicking on it.

An analysis of the provisioning is show as a report. You can save the report.

The log is marked in color in the navigation view. This mark shows you the execution status of the synchronization/provisioning.

Related Topics

- [Configuring the synchronization log](#) on page 24
- [Troubleshooting](#) on page 35

Deactivating synchronization

Regular synchronization cannot be started until the synchronization project and the schedule are active.

To prevent regular synchronization

1. Open the synchronization project in the Synchronization Editor.
2. Select the start up configuration and deactivate the configured schedule.

Now you can only start synchronization manually.

An activated synchronization project can only be edited to a limited extend. The schema in the synchronization project must be updated if schema modifications are required. The synchronization project is deactivated in this case and can be edited again.

Furthermore, the synchronization project must be deactivated if synchronization should not be started by any means (not even manually).

To deactivate the synchronization project

1. Open the synchronization project in the Synchronization Editor.
2. Select **General** on the start page.
3. Click **Deactivate project**.

Tasks after a synchronization

After the synchronization of data from the target system into the One Identity Manager database, rework may be necessary. Check the following tasks:

- [Post-processing outstanding objects](#) on page 33
- [Managing user accounts through account definitions](#) on page 34

Post-processing outstanding objects

Objects, which do not exist in the target system, can be marked as outstanding in One Identity Manager by synchronizing. This prevents objects being deleted because of an incorrect data situation or an incorrect synchronization configuration.

Outstanding objects

- Cannot be edited in One Identity Manager.
- Are ignored by subsequent synchronization.
- Are ignored by inheritance calculations.

This means, all memberships and assignments remain intact until the outstanding objects have been processed.

Start target system synchronization to do this.

To post-process outstanding objects

1. In the manager, select the **SharePoint Online | Target system synchronization: SharePoint Online** category.

All tables assigned to the target system type **SharePoint Online** as synchronization tables are displayed in the navigation view.

2. On the **Target system synchronization** form, in the **Table / object** column, open the node of the table for which you want to post-process outstanding objects.

All objects that are marked as outstanding are shown. The **Last log entry** and **Last method run** columns display the time at which the last entry was made in the synchronization log and which processing method was executed. The **No log available** entry can mean the following:

- The synchronization log has already been deleted.
- OR -
- An assignment from a member list has been deleted in the target system.
The base object of the assignment has been updated during the synchronization. A corresponding entry appears in the synchronization log. The entry in the assignment table is marked as outstanding, but there is no entry in the synchronization log.
- An object that contains a member list has been deleted in the target system.
During synchronization, the object and all corresponding entries in assignment tables are marked as outstanding. However, an entry in the synchronization log appears only for the deleted object.

TIP:

To display object properties of an outstanding object

- a. Select the object on the target system synchronization form.
- b. Open the context menu and click **Show object**.

3. Select the objects you want to rework. Multi-select is possible.
4. Click one of the following icons in the form toolbar to execute the respective method.

Table 9: Methods for handling outstanding objects

| Icon | Method | Description |
|--|---------|--|
|  | Delete | The object is immediately deleted in the One Identity Manager database. Deferred deletion is not taken into account. The Outstanding label is removed for the object. Indirect memberships cannot be deleted. |
|  | Publish | The object is added in the target system. The Outstanding label is removed for the object. The method triggers the <code>HandleOutstanding</code> event. This runs a target system specific process that triggers the provisioning process for the object. Prerequisites: <ul style="list-style-type: none"> • The table containing the object can be published. • The target system connector has write access to the target system. |
|  | Reset | The Outstanding label is removed for the object. |

5. Confirm the security prompt with **Yes**.

NOTE: By default, the selected objects are processed in parallel, which speeds up execution of the selected method. If an error occurs during processing, the action is stopped and all changes are discarded.

Bulk processing of objects must be disabled if errors are to be localized, which means the objects are processed sequentially. Failed objects are named in the error message. All changes that were made up until the error occurred are saved.

To disable bulk processing

- Deactivate  in the form toolbar.

NOTE: The target system connector must have write access to the target system in order to publish outstanding objects that are being post-processed. This means that the **Connection is read only** option is not set in the target system connection.

Managing user accounts through account definitions

Following a synchronization, employees are automatically assigned in the default installation. If an account definition for the site collection is not yet known at the time of

synchronization, user accounts are linked with employees. However, account definitions are not assigned. The user accounts are therefore in a **Linked** state.

To manage the user accounts using account definitions, assign an account definition and a manage level to these user accounts.

Detailed information about this topic

- [Assigning account definitions to linked SharePoint Online user accounts](#) on page 61

Troubleshooting

Synchronization Editor helps you to analyze and eliminate synchronization errors.

- **Simulating Synchronization**
The simulation allows you to estimate the result of synchronization. This means you can, for example, recognize potential errors in the synchronization configuration.
- **Analyzing synchronization**
You can generate the synchronization analysis report for analyzing problems which occur during synchronization, for example, insufficient performance.
- **Logging messages**
The One Identity Manager offers different options for logging errors. These include the synchronization log, the log file for One Identity Manager Service, the logging of messages with NLOG, and similar.
- **Reset start information**
If synchronization was terminated unexpectedly, for example, because a server was not available, the start information must be reset manually. Only then can the synchronization be restarted.

For more information about these topics, see the *One Identity Manager Target System Synchronization Reference Guide*.

Related Topics

- [Displaying synchronization results](#) on page 31
- [SharePoint Online synchronization features](#)

Managing SharePoint Online user accounts and employees

The central component of One Identity Manager is to map employees and their master data with permissions through which they have control over different target systems. For this purpose, information about user accounts and permissions can be read from the target system into the One Identity Manager database and linked to employees. This gives an overview of the permissions for each employees in all of the connected target systems. One Identity Manager provides the possibility to manage user accounts and their permissions. You can provision modifications in the target systems. Employees are supplied with the necessary permissions in the connected target systems according to their function in the company. Regular synchronization keeps data consistent between target systems and the One Identity Manager database.

Because requirements vary between companies, One Identity Manager offers different methods for supplying user accounts to employees. One Identity Manager supports the following method for linking employees and their user accounts.

- Employees can automatically obtain their account definitions using user account resources. If an employee does not yet have a user account in a tenant, a new user account is created. This is done by assigning account definitions to an employee using the integrated inheritance mechanism and subsequent process handling.

When you manage account definitions through user accounts, you can specify the way user accounts behave when employees are enabled or deleted.

- When user accounts are inserted, they can be automatically assigned to an existing employee. This mechanism can be implemented if a new user account is created manually or by synchronization. However, this procedure is not the default procedure for One Identity Manager. Define criteria for finding employees for automatic employee assignment.
- Employees and user accounts can be entered manually and assigned to each other.

For detailed information about employee handling and administration, see the *One Identity Manager Target System Base Module Administration Guide*.

Related Topics

- [Account definitions for SharePoint Online user accounts on page 37](#)
- [Automatic assignment of employees to SharePoint Online user accounts on page 56](#)

Account definitions for SharePoint Online user accounts

One Identity Manager has account definitions for automatically allocating user accounts to employees during working hours. You can create account definitions for every target system. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee.

Specify the manage level for an account definition for managing user accounts. The user account's manage level specifies the extent of the employee's properties that are inherited by the user account. This allows an employee to have several user accounts in one target system, for example:

- Default user account that inherits all properties from the employee
- Administrative user account that is associated to an employee but should not inherit the properties from the employee.

For more detailed information about the principles of account definitions, manage levels, and determining the valid IT operating data, see the *One Identity Manager Target System Base Module Administration Guide*.

The following steps are required to implement an account definition:

- Creating account definitions
- Configuring manage levels
- Creating the formatting rules for IT operating data
- Determining IT Operating Data
- Assigning account definitions to employees and target systems

Detailed information about this topic

- [Creating account definitions](#)
- [Editing manage levels](#)
- [Creating mapping rules for IT operating data](#)
- [Entering IT operating data](#)
- [Assigning account definitions to employees](#)
- [Assigning account definitions to target systems](#)

Creating account definitions

To create a new account definition

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Click  in the result list toolbar.
3. On the master data form, enter the master data for the account definition.
4. Save the changes.

Editing account definitions

To edit an account definition

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Change master data**.
4. Enter the account definition's master data.
5. Save the changes.

Related Topics

Master data for account definitions

Enter the following data for an account definition:

Table 10: Master Data for an Account Definition

| Property | Description |
|--------------------|---|
| Account definition | Account definition name. |
| User account table | Table in the One Identity Manager schema that maps user accounts. |
| Target | Target system to which the account definition applies. |

| Property | Description |
|-----------------------------------|--|
| system | |
| Required account definition | Required account definitions. Define the dependencies between account definitions. When this account definition is requested or assigned, the required account definition is automatically requested or assigned with it. |
| Description | Spare text box for additional explanation. |
| Manage level (initial) | Manage level to use by default when you add new user accounts. |
| Risk index | Value for evaluating the risk of assignments to employees. Enter a value between 0 and 1. This input field is only visible if the configuration parameter QER CalculateRiskIndex is activated. For more detailed information, see the <i>One Identity Manager Risk Assessment Administration Guide</i> . |
| Service item | Service item through which you can request the account definition in the IT Shop. Assign an existing service item or add a new one. |
| IT Shop | Specifies whether the account definition can be requested through the IT Shop. The account definition can be ordered by an employee over the Web Portal and distributed using a defined approval process. The account definition can also be assigned directly to employees and roles outside of IT Shop. |
| Only for use in IT Shop | Specifies whether the account definition can only be requested through the IT Shop. The account definition can be ordered by an employee over the Web Portal and distributed using a defined approval process. This means, the account definition cannot be directly assigned to roles outside the IT Shop. |
| Automatic assignment to employees | Specifies whether the account definition is assigned automatically to all internal employees. The account definition is assigned to every employee not marked as external, on saving. New employees automatically obtain this account definition as soon as they are added. i IMPORTANT: Only set this option if you can ensure that all current internal employees in the database and all pending newly added internal employees obtain a user account in this target system. Disable this option to remove automatic assignment of the account definition to all employees. The account definition cannot be reassigned to employees from this point on. Existing account definition assignments remain intact. |
| Retain account | Specifies the account definition assignment to permanently disabled employees. |

| Property | Description |
|---|---|
| definition if permanently disabled | <p>Option set: The account definition assignment remains in effect. The user account stays the same.</p> <p>Option not set: The account definition assignment is not in effect. The associated user account is deleted.</p> |
| Retain account definition if temporarily disabled | <p>Specifies the account definition assignment to temporarily disabled employees.</p> <p>Option set: The account definition assignment remains in effect. The user account stays the same.</p> <p>Option not set: The account definition assignment is not in effect. The associated user account is deleted.</p> |
| Retain account definition on deferred deletion | <p>Specifies the account definition assignment on deferred deletion of employees.</p> <p>Option set: The account definition assignment remains in effect. The user account stays the same.</p> <p>Option not set: The account definition assignment is not in effect. The associated user account is deleted.</p> |
| Retain account definition on security risk | <p>Specifies the account definition assignment to employees posing a security risk.</p> <p>Option set: The account definition assignment remains in effect. The user account stays the same.</p> <p>Option not set: The account definition assignment is not in effect. The associated user account is deleted.</p> |
| Resource type | Resource type for grouping . |
| Spare field 01 - spare field 10 | Additional company specific information. Use Designer to customize display names, formats and templates for the input fields. |

Editing manage levels

One Identity Manager supplies a default configuration for manage levels:

- **Unmanaged:** User accounts with the **Unmanaged** manage level are linked to the employee but they do not inherit any further properties. When a new user account is added with this manage level and an employee is assigned, some of the employee's properties are transferred initially. If the employee properties are changed at a later date, the changes are not passed onto the user account.
- **Full managed:** User accounts with the **Full managed** manage level inherit defined properties of the assigned employee. When a new user account is created

with this manage level and an employee is assigned, the employee's properties are transferred in an initial state. If the employee properties are changed at a later date, the changes are passed onto the user account.

To edit a manage level

1. In Manager, select **SharePoint Online | Basic configuration data | Account definitions | Manage levels**.
2. Select the manage level in the result list.
3. Select **Change master data**.
4. Edit the manage level's master data.
5. Save the changes.

Related Topics

- [Master data for manage levels](#) on page 42
- [Entering IT operating data](#) on page 45

Creating manage levels

The One Identity Manager supplies a default configuration for the **Unmanaged** and **Full managed** manage levels. You can define other manage levels depending on your requirements.

IMPORTANT: In Designer, extend the templates by adding the procedure for the additional manage levels. For detailed information about templates, see the *One Identity Manager Configuration Guide*.

To create a manage level

1. In Manager, select **SharePoint Online | Basic configuration data | Account definitions | Manage levels**.
2. Click  in the result list toolbar.
3. On the master data form, edit the master data for the manage level.
4. Save the changes.

Related Topics

- [Master data for account definitions](#) on page 38

Master data for manage levels

Enter the following data for a manage level.

Table 11: Master Data for a Manage Level

| Property | Description |
|---|---|
| Manage level | Name of the manage level. |
| Description | Spare text box for additional explanation. |
| IT operating data overwrites | Specifies whether user account data formatted from IT operating data is automatically updated. Permitted values are: <ul style="list-style-type: none"> • Never: Data is not updated. • Always: Data is always updated. • Only initially: The data is only determined at the start. |
| Retain groups if temporarily disabled | Specifies whether user accounts of temporarily disabled employees retain their group memberships. |
| Lock user accounts if temporarily disabled *) | Specifies whether user accounts of temporarily disabled employees are locked. |
| Retain groups if permanently disabled | Specifies whether user accounts of permanently disabled employees retain group memberships. |
| Lock user accounts if permanently disabled *) | Specifies whether user accounts of permanently disabled employees are locked. |
| Retain groups on deferred deletion | Specifies whether user accounts of employees marked for deletion retain their group memberships. |
| Lock user accounts if deletion is deferred*) | Specifies whether user accounts of employees marked for deletion are locked. |
| Retain groups on security risk | Specifies whether user accounts of employees posing a security risk retain their group memberships. |
| Lock user accounts if security is at risk*) | Specifies whether user accounts of employees posing a security risk are locked. |
| Retain groups if user account disabled | Specifies whether locked user accounts retain their group memberships. |

Property**Description**

i **NOTE:** SharePoint Online user accounts cannot be locked!

When an employee is disabled, deleted (with delay) or rated as a security risk, their SharePoint Online user accounts remain enabled. For logging into a SharePoint Online site collection, you need to know if the user account referenced as an authentication object is locked or disabled. To prevent a disabled, deleted or security risk employee logging into a SharePoint Online site collection, manage the user accounts linked as authentication objects using account definitions.

Creating mapping rules for IT operating data

An account definition specifies which rules are used to form the IT operating data and which default values will be used if no IT operating data can be found through the employee's primary roles.

The following IT operating data is used in the One Identity Manager default configuration for automatic creating and modifying of user accounts for an employee in the target system.

- SharePoint Online authentication mode
- Groups can be inherited
- Privileged user account

To create a mapping rule for IT operating data

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.

3. Select **Edit IT operating data mapping** and enter the following data.

Table 12: Mapping rule for IT operating data

| Property | Description |
|-----------------------------------|--|
| Column | User account property for which the value is set. In the menu, you can select the columns that use the TSB_ITDataFromOrg script in their template. |
| Source | <p>Specifies which roles to use in order to find the user account properties. You have the following options:</p> <ul style="list-style-type: none"> • Primary department • Primary location • Primary cost center • Primary business roles <p>i NOTE: Only use the primary business role if the Business Roles Module is installed.</p> <ul style="list-style-type: none"> • Empty <p>If you select a role, you must specify a default value and set the option Always use default value.</p> |
| Default value | Default value of the property for an employee's user account if the value is not determined dynamically from the IT operating data. |
| Always use default value | Specifies whether user account properties are always filled with the default value. IT operating data is not determined dynamically from a role. |
| Notify when applying the standard | Specifies whether email notification to a defined mailbox is sent when the default value is used. The Employee - new user account with default properties created mail template is used. To change the mail template, adjust the TargetSystem SharePointOnline Accounts MailTemplateDefaultValues configuration parameter. |

4. Save the changes.

Entering IT operating data

To create user accounts with the **Full managed** manage level, the required IT operating data must be determined. The operating data required to automatically supply an employee with IT resources is shown in the departments, locations, cost centers, and business roles. An employee is assigned to one primary location, one primary department, one primary cost center or one primary business role. The necessary IT operating data is

ascertained from these assignments and used in creating the user accounts. Default values are used if valid IT operating data cannot be found over the primary roles.

You can also specify IT operating data directly for a specific account definition.

Example

Normally, each employee in department A obtains a default user account in the tenantA. In addition, certain employees in department A obtain administrative user accounts in the tenantA.

Create an account definition A for the default user account of the A and an account definition B for the administrative user account of tenant A. Specify the property "Department" in the IT operating data formatting rule for the account definitions A and B in order to determine the valid IT operating data.

Specify the effective IT operating data of department A for the tenant A. This IT operating data is used for standard user accounts. In addition, specify the effective account definition B IT operating data for department A. This IT operating data is used for administrative user accounts.

To define IT operating data

1. In Manager, select the role in the **Organizations** or **Business roles** category.
2. Select **Edit IT operating data** in the task view and enter the following data.

Table 13: IT operating data

| Property | Description |
|----------------------------|---|
| Organization/Business role | Department, cost center, location or business role for which the IT operating data is valid. |
| Effects on | IT operating data application scope. The IT operating data can be used for a target system or a defined account definition. |
| | <p>To specify an application scope</p> <ol style="list-style-type: none"> a. Click  next to the text box. b. Under Table, select the table that maps the target system for select the TSBAccountDef table for an account definition. c. Select the specific target system or account definition under Effects on. d. Click OK. |
| Column | User account property for which the value is set. |

| Property | Description |
|----------|--|
| | In the menu, you can select the columns that use the TSB_ITDataFromOrg script in their template. |
| Value | Concrete value which is assigned to the user account property. |

3. Save the changes.

Modify IT operating data

If IT operating data changes, you must transfer these changes to the existing user accounts. To do this, templates must be rerun on the affected columns. Before you can run the templates, you can check what effect a change to the IT operating data has on the existing user accounts. You can decide whether the change is transferred to the One Identity Manager database in the case of each affected column in each affected database.

Prerequisites

- The IT operating data of a was changed.
- OR -
- The default values in the IT operating data template were modified for an account definition.

NOTE: If the assignment of an employee changes, the templates are automatically executed.

To execute the template

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Execute templates** in the task view

This displays a list of all user account, which are created through the selected account definition and whose properties are changed by modifying the IT operating data.

Old Current value of the object property.

value:

New Value that the object property would have following modification of the value:
IT operating data.

Selection: Specifies whether the modification shall be adopted for the user account.

4. Mark all the object properties in the **selection** column that will be given the new value.
5. Click **Apply**.

The templates are applied to all selected user accounts and properties.

Assigning account definitions to employees

Account definitions are assigned to company employees.

Indirect assignment is the default method for assigning account definitions to employees. Account definitions are assigned to departments, cost centers, locations or roles. The employees are categorized into these departments, cost centers, locations or roles depending on their function in the company and thus obtain their account definitions. To react quickly to special requests, you can assign individual account definitions directly to employees.

You can automatically assign special account definitions to all company employees. It is possible to assign account definitions to the IT Shop as requestable products. A department manager can then request user accounts from the Web Portal for his staff. It is also possible to add account definitions to system roles. These system roles can be assigned to employees through hierarchical roles or directly or added as products in the IT Shop.

In the One Identity Manager default installation, the processes are checked at the start to see if the employee already has a user account in the target system that has an account definition. If no user account exists, a new user account is created with the account definition's default manage level.

- 1 **NOTE:** If a user account already exists and is disabled, then it is re-enabled. You have to alter the user account manage level afterwards in this case.

Prerequisites for indirect assignment of account definitions to employees

- Assignment of employees and account definitions is permitted for role classes (department, cost center, location or business role).

- 1 **NOTE:** As long as an account definition for an employee is valid, the employee retains the user account that was created by it. If the assignment of an account definition is removed, the user account that was created from this account definition is deleted.

For detailed information about preparing role classes to be assigned, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Detailed information about this topic

- [Assigning account definitions directly to employees](#) on page 51
- [Assigning account definitions to system roles](#) on page 51
- [Adding account definitions in the IT Shop](#) on page 52

Detailed information about this topic

Assigning account definitions to departments, cost centers, and locations

To add account definitions to hierarchical roles

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Assign organizations**.
4. Assign organizations in **Add assignments**.
 - Assign departments on the **Departments** tab.
 - Assign locations on the **Locations** tab.
 - Assign cost centers on the **Cost centers** tab.

TIP: In the **Remove assignments** area, you can remove the assignment of organizations.

To remove an assignment

- Select the organization and double click .
5. Save the changes.

Assigning account definitions to business roles

Installed modules: Business Roles Module

To add account definitions to hierarchical roles

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Assign business roles**.
4. Assign business roles in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of business roles.

To remove an assignment

- Select the business role and double click .

5. Save the changes.

Assigning account definitions to all employees

To assign an account definition to all employees

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Change master data**.
4. Set **Automatic assignment to employees on General**.

IMPORTANT: Only set this option if you can ensure that all current internal employees in the database and all pending newly added internal employees obtain a user account in this target system.

5. Save the changes.

The account definition is assigned to every employee that is not marked as external. New employees automatically obtain this account definition as soon as they are added. The assignment is calculated by the DBQueue Processor.

NOTE: Disable **Automatic assignment to employees** to remove automatic assignment of the account definition to all employees. The account definition cannot be reassigned to employees from this point on. Existing assignments remain intact.

Assigning account definitions directly to employees

To assign an account definition directly to employees

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Assign to employees**.
4. Assign employees in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of employees.

To remove an assignment

- Select the employee and double click .

5. Save the changes.

Assigning account definitions to system roles

Installed modules: System Roles Module

NOTE: Account definitions with **Only use in IT Shop** can only be assigned to system roles that also have this option set.

To add account definitions to a system role

1. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Assign system roles**.
4. Assign system roles in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of system roles.

To remove an assignment

- Select the system role and double click .

5. Save the changes.

Adding account definitions in the IT Shop

A account definition can be requested by shop customers when it is assigned to an IT Shop shelf. To ensure it can be requested, further prerequisites need to be guaranteed.

- The account definition must be labeled with the **IT Shop** option.
 - The account definition must be assigned to a service item.
 - 1 **TIP:** In Web Portal, all products that can be requested are grouped together by service category. To make the account definition easier to find in Web Portal, assign a service category to the service item.
 - If the account definition is only assigned to employees using IT Shop assignments, you must also set **Only for use in IT Shop**. Direct assignment to hierarchical roles may not be possible.
- 1 **NOTE:** IT Shop administrators can assign account definitions to IT Shop shelves if login is role-based. Target system administrators are not authorized to add account definitions in the IT Shop.

To add an account definition to the IT Shop

1. In Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions** (non-role-based login).
- OR -
In Manager, select **Entitlements | Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Add to IT Shop**.
4. Assign the account definitions to the IT Shop shelves in **Add assignments**.
5. Save the changes.

To remove an account definition from individual IT Shop shelves

1. In Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions** (non-role-based login).
- OR -
In Manager, select **Entitlements | Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Add to IT Shop**.
4. Remove the account definitions from the IT Shop shelves in **Remove assignments**.
5. Save the changes.

To remove an account definition from all IT Shop shelves

1. In Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**(non-role-based login).
- OR -
In Manager, select **Entitlements | Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.

The account definition is removed from all shelves by One Identity Manager Service. All requests and assignment requests with this account definition are canceled in the process.

For detailed information about requesting company resources through IT Shop, see the *One Identity Manager IT Shop Administration Guide*.

- [Master data for account definitions](#) on page 38

Assigning account definitions to target systems

The following prerequisites must be fulfilled if you implement automatic assignment of user accounts and employees resulting in administered user accounts (state **Linked configured**):

- The account definition is assigned to the target system.
- The account definition has the default manage level.

User accounts are only linked to the employee (**Linked**) if no account definition is given. This is the case on initial synchronization, for example.

To assign the account definition to a target system

1. In Manager, select the site collection in **SharePoint Online | Site collections**.
2. Select **Change master data**.
3. Select the account definition for user accounts from **Account definition (initial)**.
4. Save the changes.

Related Topics

Deleting account definitions

You can delete account definitions if they are not assigned to target systems, employees, hierarchical roles or any other account definitions.

To delete an account definition

1. Remove automatic assignments of the account definition from all employees.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.
 - c. Select **Change master data**.
 - d. Disable **Automatic assignment to employees** on the **General** tab.
 - e. Save the changes.
2. Remove direct assignments of the account definition to employees.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.
 - c. Select **Assign to employees**.
 - d. Remove employees from **Remove assignments**.
 - e. Save the changes.
3. Remove the account definition's assignments to departments, cost centers and locations.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.
 - c. Select **Assign organizations**.
 - d. In **Remove assignments**, remove the relevant departments, cost centers, and locations.
 - e. Save the changes.
4. Remove the account definition's assignments to business roles.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.

- c. Select **Assign business roles**.
 - Remove the business roles in **Remove assignments**.
 - d. Save the changes.
5. Remove the assignment of the account definition to IT operating data.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.
 - c. Select **Edit IT operating data mapping**.
 - d. Select a column and click **Delete** to remove the mapping rule.
 - e. Delete all mapping rules.
 - f. Save the changes.
 6. If the account definition was requested through the IT Shop, it must be canceled and removed from all IT Shop shelves.

For more detailed information about unsubscribing requests, see the *One Identity Manager Web Portal User Guide*.

To remove an account definition from all IT Shop shelves

- a. In Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**(non-role-based login).
 - OR -
 - In Manager, select **Entitlements | Account definitions** (role-based login).
 - b. Select an account definition in the result list.
 - c. Select **Remove from all shelves (IT Shop)**.
 - d. Confirm the security prompt with **Yes**.
 - e. Click **OK**.

The account definition is removed from all shelves by One Identity Manager Service. All requests and assignment requests with this account definition are canceled in the process.
7. Remove the account definition assignment as required account definition for another account definition. As long as the account definition is required for another account definition, it cannot be deleted. Check all the account definitions.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.
 - c. Select **Change master data**.
 - d. Remove the account definition in the **Required account definition** menu.
 - e. Save the changes.

8. Remove the account definition's assignments to target systems.
 - a. In Manager, select the site collection in **SharePoint Online | Site collections**.
 - b. Select **Change master data**.
 - c. Remove the assigned account definitions on the **General** tab.
 - d. Save the changes.
9. Delete the account definition.
 - a. In the Manager, select **SharePoint Online | Basic configuration data | Account definitions | Account definitions**.
 - b. Select an account definition in the result list.
 - c. Click  to delete an account definition.

Automatic assignment of employees to SharePoint Online user accounts

When you add a user account, an existing employee can be assigned automatically. This mechanism can follow after a new user account has been created manually or through synchronization. Define criteria for finding employees to apply to automatic employee assignment. If a user account is linked to an employee through the current mode, the user account is given, through an internal process, the default manage level of the account definition entered in the user account's target system. You can customize user account properties depending on how the behavior of the manage level is defined.

If you run this procedure during working hours, automatic assignment of employees to user accounts takes place from that moment onwards. If you disable the procedure again later, the changes only affect user accounts added or updated after this point in time. Existing employee assignment to user accounts remain intact.

 **NOTE:** It is not recommended to assign employees using automatic employee assignment in the case of administrative user accounts. Use **Change master data** to assign employees to administrative user account for the respective user account.

Prerequisites:

- On the user accounts, **User** is selected in the **Principal type** selection list.
- The user accounts are not assigned an authentication object

Run the following tasks to assign employees automatically.

- If you want employees to be assigned during the synchronization of user accounts, in the Designer, enable the configuration parameter **TargetSystem | SharePointOnline | PersonAutoFullsync** and select the required mode.

- If you want employees to be assigned outside synchronization, in the Designer activate the configuration parameter **TargetSystem | SharePointOnline | PersonAutoDefault** and select the required mode.
- Assign an account definition to the site collection. Ensure that the manage level to be used is entered as the default manage level.
- Define the search criteria for employees assigned to the site collection.

NOTE:

The following applies for synchronization:

- Automatic employee assignment takes effect if user accounts are added or updated.

The following applies outside synchronization:

- Automatic employee assignment takes effect if user accounts are added.

NOTE:

Following a synchronization, employees are automatically assigned in the default installation. If an account definition for the site collection is not yet known at the time of synchronization, user accounts are linked with employees. However, account definitions are not assigned. The user accounts are therefore in a **Linked** state.

To manage the user accounts using account definitions, assign an account definition and a manage level to these user accounts.

For more information, see [Managing user accounts through account definitions](#) on page 34.

Related Topics

- [Creating account definitions](#) on page 38
- [Assigning account definitions to target systems](#) on page 53
- [Changing the manage level in SharePoint Online user accounts](#) on page 60
- [Editing search criteria for automatic employee assignment](#) on page 57

Editing search criteria for automatic employee assignment

The criteria for employee assignment are defined for the site collection. In this case, you specify which user account properties must match the employee's properties such that the employee can be assigned to the user account. You can limit search criteria further by using format definitions. The search criterion is written in XML notation to the **Search criteria for automatic employee assignment** column (AccountToPersonMatchingRule) in the 03SSite table.

Search criteria are evaluated when employees are automatically assigned to user accounts. Furthermore, you can create a suggestion list for assignments of employees to user accounts based on the search criteria and make the assignment directly.

NOTE: When the employees are assigned to user accounts on the basis of search criteria, user accounts are given the default manage level of the account definition entered in the user account's target system. You can customize user account properties depending on how the behavior of the manage level is defined.

It is not recommended to make assignment to administrative user accounts based on search criteria. Use **Change master data** to assign employees to administrative user account for the respective user account.

To specify criteria for employee assignment

1. Select **SharePoint Online | Site collections**.
2. Select the site collection in the result list.
3. Select **Define search criteria for employee assignment** in the task view.
4. Specify which user account properties must match with which employee so that the employee is linked to the user account.

Table 14: Standard search criteria for user accounts

| Apply to | Column for employee | Column for user account |
|--|---|-------------------------|
| SharePoint Online user accounts (user authenticated) | Default email address (DefaultEmailAddress) | Email address (EMail) |

5. Save the changes.

For detailed information about defining search criteria, see the *One Identity Manager Target System Base Module Administration Guide*.

Related Topics

- [Automatic assignment of employees to SharePoint Online user accounts](#) on page 56
- [Finding employees and directly assigning them to user accounts](#) on page 58

Finding employees and directly assigning them to user accounts

Based on the search criteria, you can create a suggestion list for the assignment of employees to user accounts and make the assignment directly. User accounts are grouped in different views for this.

Table 15: Manual Assignment View

| View | Description |
|-----------------------------|---|
| Suggested assignments | This view lists all user accounts to which One Identity Manager can assign an employee. All employees are shown who were found using the search criteria and can be assigned. |
| Assigned user accounts | This view lists all user accounts to which an employee is assigned. |
| Without employee assignment | This view lists all user accounts to which no employee is assigned and for which no employee was found using the search criteria. |

To apply search criteria to user accounts

1. Select **SharePoint Online | Site collections** in the manager.
2. In the result list, select the site collection.
3. Select **Define search criteria for employee assignment** in the task view.
4. At the bottom of the form click **Reload**.

All possible assignments based on the search criteria are found in the target system for all user accounts. The three views are updated.

TIP: By double-clicking on an entry in the view, you can view the user account and employee master data.

The assignment of employees to user accounts creates connected user accounts (status **Linked**). To create managed user accounts (status **Linked configured**), you can assign an account definition at the same time.

To assign employees directly over a suggestion list

- Click **Suggested assignments**.
 1. Click **Selection** for all user accounts to which you want to assign the suggested employees. Multi-select is possible.
 2. (Optional) Select an account definition in the **Assign this account definition** menu, and select a manage level in the **Assign this account manage level** menu.
 3. Click **Assign selected**.
 4. Confirm the security prompt with **Yes**.

The employees determined using the search criteria are assigned to the selected user accounts. If an account definition was selected, this is assigned to all selected user accounts.

- OR -

- Click **No employee assignment**.

1. Click **Select employee** for the user account to which you want to assign an employee. Select an employee from the menu.
2. Click **Selection** for all user accounts to which you want to assign the selected employees. Multi-select is possible.
3. (Optional) Select an account definition in the **Assign this account definition** menu, and select a manage level in the **Assign this account manage level** menu.
4. Click **Assign selected**.
5. Confirm the security prompt with **Yes**.

The employees displayed in the **Employee** column are assigned to the selected user accounts. If an account definition was selected, this is assigned to all selected user accounts.

To remove assignments

- Click **Assigned user accounts**.
 1. Click **Selection** for all user accounts for which you want to delete the employee assignment. Multi-select is possible.
 2. Click **Remove selected**.
 3. Confirm the security prompt with **Yes**.

The assigned employees are removed from the selected user accounts.

Changing the manage level in SharePoint Online user accounts

The default manage level is applied if you create user accounts using automatic employee assignment. You can change a user account manage level later.

To change the manage level for a user account

1. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
2. Select the user account in the result list.
3. Select **Change master data**.
4. On the **General** tab, select the manage level in the **Manage level** menu.
5. Save the changes.

Assigning account definitions to linked SharePoint Online user accounts

An account definition can be subsequently assigned to user accounts with **Linked** status. This may be necessary, for example, if:

- employees and user accounts have been linked manually
- automatic employee assignment is configured, but an account definition is not yet assigned in the SharePoint Online system.

To select user accounts through account definitions

1. Create an account definition.
2. Assign an account definition to the site collection.
3. Assign the account definition and manage level to user accounts in **linked** status.
 - a. In Manager, select **SharePoint Online | User accounts (user authenticated) | Linked but not configured | <Site collection>**.
 - b. Select **Assign account definition to linked accounts**.

Detailed information about this topic

- [Assigning account definitions to target systems](#) on page 53

Manually linking employees to SharePoint Online user accounts

An employee can be linked to multiple SharePoint Online user accounts, for example, so that you can assign an administrative user account in addition to the default user account. One employee can also use default user accounts with different types.

- NOTE:** To enable working with identities for user accounts, the employees also need identities. You can only link user accounts to which an identity is assigned with employees who have this same identity.

To manually assign user accounts to an employee

1. Select the **Employees | Employees**.
2. Select the employee in the result list and run **Assign SharePoint Online user accounts** from the task view.
3. Assign the user accounts.
4. Save the changes.

Related Topics

- [Supported user account types](#) on page 63

SharePoint Online user account use cases

Example

Set up guest access to a site collection with read-only permissions. To do this, a SharePoint Online user account is created. The Azure Active Directory **Guests** group is assigned as authentication object to the user account. Clara Harris owns an Azure Active Directory user account, which is a member in this group. She can log in to the site collection with this and obtain all the SharePoint Online user account's permissions.

Jan Bloggs is also requires guest access to the site collection. He owns an Azure Active Directory user account in the same domain. In the Web Portal, he requests membership of the Azure Active Directory **Guests** group. Once the request is granted approval and assigned, he can log in on the site collection.

SharePoint Online access permissions are supplied in different ways in the One Identity Manager, depending on the referenced authentication object.

Case 1: The associated authentication object is a group. The authentication system is managed in One Identity Manager. (Default case)

- The user account represents an Azure Active Directory group. This group can be assigned in the One Identity Manager as authentication object.
- The user account cannot be assigned to an employee. This means, the user account can only become a member in SharePoint Online roles and groups through direct assignment.
- Before an employee can log in to the SharePoint Online system, they require an Azure Active Directory user account. This user account must be a member of the Azure Active Directory group that is used as an authentication object.
- A new SharePoint Online user account can be created manually.
- The user account cannot be managed through an account definition.

Case 2: The authentication object is a user account. The authentication system is managed in One Identity Manager.

- The user account represents an Azure Active Directory user account. The user account is not assigned as an authentication object in One Identity Manager.
- The SharePoint Online user account can be assigned to an employee. This means that the user account can become a member in SharePoint Online roles and groups through inheritance and direct assignment.

If an authentication object is assigned, the connected employee is found through the authentication object.

If there is no authentication object assigned, the employee can be assigned automatically or manually. Automatic employee assignment depends on the **TargetSystem | SharePointOnline | PersonAutoFullsync** and **TargetSystem | SharePointOnline | PersonAutoDefault** configuration parameters.

- A new SharePoint Online user account can be manually created or by using an account definition. The Azure Active Directory user account used as the authentication object must belong to a domain trusted by the referenced authentication system.
- The user account can be managed through an account definition.

For detailed information about employee handling and administration, see the *One Identity Manager Target System Base Module Administration Guide*.

Supported user account types

Different types of user accounts, such as default user accounts, administrative user accounts, service accounts, or privileged user accounts can be mapped in One Identity Manager.

The following properties are used for mapping different user account types.

- Identity

The **Identity** property (IdentityType column) is used to describe the type of user account.

Table 16: Identities of user accounts

| Identity | Description | Value of the IdentityType column |
|------------------|----------------------------------|---|
| Primary identity | Employee's default user account. | Primary |

| Identity | Description | Value of the IdentityType column |
|-----------------------------|--|----------------------------------|
| Organizational identity | Secondary user account used for different roles in the organization, for example for subcontracts with other functional areas. | Organizational |
| Personalized admin identity | User account with administrative permissions, used by one employee. | Admin |
| Sponsored identity | User account that is used for training purposes, for example. | Sponsored |
| Shared identity | User account with administrative permissions, used by several employees. | Shared |
| Service identity | Service account. | Service |

NOTE: To enable working with identities for user accounts, the employees also need identities. You can only link user accounts to which an identity is assigned with employees who have this same identity.

The primary identity, the organizational identity, and the personal admin identity are used for different user accounts, which can be used by the same actual employee to execute their different tasks within the company.

To provide user accounts with a personal admin identity or an organizational identity for an employee, you create subidentities for the employee. These subidentities are then linked to user accounts, enabling you to assign the required Entitlements to the different user accounts.

User accounts with a sponsored identity, group identity, or service identity are linked to dummy employees that do not refer to a real person. These dummy employees are needed so that Entitlements can be inherited by the user accounts. When evaluating reports, attestations, or compliance checks, check whether dummy employees need to be considered separately.

For detailed information about mapping employee identities, see the *One Identity Manager Identity Management Base Module Administration Guide*.

- Privileged user account

Privileged user accounts are used to provide employees with additional privileges. This includes administrative user accounts or service accounts, for example. The user accounts are marked as **Privileged user account** (Column IsPrivilegedAccount).

Detailed information about this topic

- [Default user accounts](#) on page 65
- [Administrative user accounts](#) on page 66

- [Privileged User Accounts](#) on page 68

Default user accounts

Normally, each employee obtains a default user account, which has the permissions they require for their regular work. The user accounts are linked to the employee. By default, the link between employee and SharePoint Online user account is set up through the authentication objects to which the user account is assigned. Alternatively, employees can also be directly linked to the user accounts. Such user accounts can be managed through account definitions. The effect of the link and the scope of the employee's inherited properties on the user accounts can be configured through an account definition and its manage levels.

To create default user accounts through account definitions

1. Create an account definition and assign the **Unmanaged** and **Full managed** manage levels.
2. Specify the effect of temporarily or permanently disabling, deleting or the security risk of an employee on its user accounts and group memberships for each manage level.
3. Create a formatting rule for IT operating data.

You use the mapping rule to define which rules are used to map the IT operating data for the user accounts, and which default values are used if no IT operating data can be determined via a person's primary roles.

Which IT operating data is required depends on the target system. The following settings are recommended for default user accounts:

- In the mapping rule for the `IsGroupAccount` column, use the default value **1** and enable **Always use default value**.
 - In the mapping rule for the `IdentityType` column, use the default value **Primary** and enable **Always use default value**.
4. Enter the effective IT operating data for the target system. Select the concrete target system under **Effects on**.

Specify in the departments, cost centers, locations, or business roles which IT operating data should apply when you set up a user account.

5. Assign the account definition to employees.

When the account definition is assigned to an employee, a new user account is created through the inheritance mechanism and subsequent processing.

Administrative user accounts

An administrative user account must be used for certain administrative tasks. Administrative user accounts are usually predefined by the target system and have fixed names and login names, such as **Administrator**.

Administrative user accounts are imported into One Identity Manager during synchronization.

NOTE: Some administrative user accounts can be automatically identified as privileged user accounts. To do this, enable the **Mark selected user accounts as privileged** schedule in Designer.

Related Topics

- [Providing administrative user accounts for multiple employees](#) on page 67

Providing administrative user accounts for one employee

Prerequisites

- The user account must be labeled as a personalized admin identity.
- The employee who will be using the user account must be labeled as a personalized admin identity.
- The employee who will be using the user account must be linked to a main identity.

To prepare an administrative user account for a person

1. Label the user account as a personalized admin identity.
 - a. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
 - b. Select the user account in the result list.
 - c. Select **Change master data**.
 - d. On the **General** tab, in the **Identity** selection list, select **Personalized administrator identity**.
2. Link the user account to the employee who will be using this administrative user account.

- a. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
- b. Select the user account in the result list.
- c. Select **Change master data**.
- d. On the **General** tab, in the **Person** selection list, select the employee who will be using this administrative user account.

TIP: If you are the target system manager, you can choose  to create a new person.

Related Topics

- For detailed information about mapping employee identities, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Providing administrative user accounts for multiple employees

Prerequisite

- The user account must be labeled as a shared identity.
- A dummy employee must exist. The dummy employee must be labeled as a shared identity and must have a manager.
- The employees who are permitted to use the user account must be labeled as a primary identity.

To prepare an administrative user account for multiple employees

1. Label the user account as a shared identity.
 - a. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
 - b. Select the user account in the result list.
 - c. Select **Change master data**.
 - d. On the **General** tab, in the **Identity** selection list, select **Shared identity**.

2. Link the user account to a dummy employee.
 - a. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
 - b. Select the user account in the result list.
 - c. Select **Change master data**.
 - d. On the **General** tab, select the dummy employee from the **Employee** selection list.

TIP: If you are the target system manager, you can choose  to create a new dummy employee.

3. Assign the employees who will use this administrative user account to the user account.
 - a. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
 - b. Select the user account in the result list.
 - c. Select the task **Assign employees authorized to use**.
 - d. Assign employees in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of employees.
To remove an assignment
 - Select the employee and double click .

- For detailed information about mapping employee identities, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Privileged User Accounts

Privileged user accounts are used to provide employees with additional privileges. This includes administrative user accounts or service accounts, for example. The user accounts are marked as **Privileged user account** (Column IsPrivilegedAccount).

NOTE: The criteria according to which user accounts are automatically identified as privileged are defined as extensions to the view definition (ViewAddOn) in the TSBVAccountIsPrivDetectRule table (which is a table of the **Union** type). The evaluation is done in the script TSB_SetIsPrivilegedAccount.

To create privileged users through account definitions

1. Create an account definition. Create a new manage level for privileged user accounts and assign this manage level to the account definition.
2. If you want to prevent the properties for privileged user accounts from being overwritten, set the **IT operating data overwrites** property for the manage level to **Only initially**. In this case, the properties are populated just once when the user accounts is created.
3. Specify the effect of temporarily or permanently disabling or deleting, or the security risk of an employee on its user accounts and group memberships for each manage level.
4. Create a formatting rule for IT operating data.

You use the mapping rule to define, for example, which rules are used to map the IT operating data for the user accounts, and which default values are used if no IT operating data can be determined via a person's primary roles.

Which IT operating data is required depends on the target system. The following settings are recommended for privileged user accounts:

- In the mapping rule for the IsPrivilegedAccount column, use the default value **1** and enable **Always use default value**.
 - You can also specify a mapping rule for the IdentityType column. The column owns different permitted values that represent user accounts.
 - To prevent privileged user accounts from inheriting the Entitlements of the default user, define a mapping rule for the IsGroupAccount column with a default value of **0** and enable **Always use default value**.
5. Enter the effective IT operating data for the target system.
Specify in the departments, cost centers, locations, or business roles which IT operating data should apply when you set up a user account.
 6. Assign the account definition directly to employees who work with privileged user accounts.

When the account definition is assigned to an employee, a new user account is created through the inheritance mechanism and subsequent processing.

TIP: If customization requires that the of privileged user accounts follow a defined naming convention, create the template according to which the are formed.

- [Account definitions for SharePoint Online user accounts](#) on page 37

Managing the assignments of SharePoint Online groups and roles

User accounts inherit SharePoint Online permissions through SharePoint Online roles and SharePoint Online groups. SharePoint Online groups are always defined for one site collection in this way. SharePoint Online roles are defined for sites. They are assigned to groups, and the user accounts that are members of these groups inherit SharePoint Online permissions through them. SharePoint Online roles can also be assigned directly to user accounts. User account permissions on individual sites in a site collection are restricted through the SharePoint Online roles that are assigned to it.

In a SharePoint Online, the users can have different entitlements, which are mapped in One Identity Manager as follows:

- Entitlement for the use of SharePoint Online groups
Table: **SharePoint Online groups** (O3SGroup)
- Entitlement for the use of SharePoint Online roles
Table: **SharePoint Online roles** (O3SRLAsgn)

Terms

- A SharePoint Online Role is the permission level linked to a fixed site.
- The assignment of user account or groups to a SharePoint Online role is called a role assignment.

Entitlement assignments refer to the assignment of the various entitlements to user accounts. These include:

- Assignments to groups (table O3SUserInGroup)
- Assignments to groups (table O3SUserHasRLAsgn)

Assigning SharePoint Online entitlements to SharePoint Online user accounts in One Identity Manager

In One Identity Manager, SharePoint Online entitlements can be assigned directly or indirectly to employees.

In the case of indirect assignment, employees and entitlements are organized in hierarchical roles. The number of entitlements assigned to an employee is calculated from

the position in the hierarchy and the direction of inheritance. If the employee has a SharePoint Online user account, the entitlements are assigned to this user account.

Entitlements can also be assigned to employees via IT Shop requests. To enable the assignment of entitlements via IT Shop requests, employees are added as customers in a shop. All entitlements assigned to this shop as products can be requested by the customers. After approval is granted, requested entitlements are assigned to the employees.

You can use system roles to group entitlements together and assign them to employees as a package. You can create system roles that contain only SharePoint Online entitlements. System entitlements from different target systems can also be grouped together in a system role.

To react quickly to special requests, you can also assign the entitlements directly to user accounts.

Prerequisites

- The assignment of employees, SharePoint Online roles, and SharePoint Online groups is permitted for departments, cost centers, locations, or business roles.

NOTE: If a SharePoint Online role refers to a permission level for which **Hidden** is set, no business roles and organizations can be assigned. These SharePoint Online roles can be neither directly nor indirectly assigned to user accounts or groups.

- **Group authenticated** is not set in the user accounts.
- The user accounts are marked with the option **Groups can be inherited**.
- User accounts and SharePoint Online entitlements belong to the same site collection.

Assigning SharePoint Online permissions to departments, cost centers, and locations

Assign groups and roles to departments, cost centers, and locations in order to assign them to user accounts through these organizations.

To assign a permission to a department, cost center or location (non role-based login):

1. Select one of the following categories.
 - **SharePoint Online | Groups**
 - **SharePoint Online | Roles**
 2. Select the permissions in the result list.
 3. Select **Assign organizations**.
 4. Assign organizations in **Add assignments**.
 - Assign departments on the **Departments** tab.
 - Assign locations on the **Locations** tab.
 - Assign cost centers on the **Cost centers** tab.
- TIP:** In the **Remove assignments** area, you can remove the assignment of organizations.
- To remove an assignment**
- Select the organization and double click .
5. Save the changes.

To assign permissions to a department, cost center or location (role-based login)

1. Select **Organizations | Departments**.
 - OR -
 - Select the category **Organizations | Cost centers**.
 - OR -
 - Select the category **Organizations | Locations**.

2. Select the department, cost center or location in the result list.
3. Select one of the following tasks.
 - **Assign SharePoint Online groups**
 - **Assign SharePoint Online roles**
4. Assign the permissions in the **Add assignments** view.
- OR -
Remove the permissions in the **Remove assignments** area.
5. Save the changes.

Assigning SharePoint Online permissions to business roles

Installed modules: Business Roles Module

You assign permissions to business roles so that these permissions are assigned to user accounts via these business roles.

To assign a permission to business roles (non role-based login):

1. Select one of the following categories.
 - **SharePoint Online | Groups**
 - **SharePoint Online | Roles**
2. Select the permissions in the result list.
3. Select **Assign business roles** in the task view.
4. Assign business roles in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of business roles.

To remove an assignment

- Select the business role and double click .
5. Save the changes.

To assign permissions to a business role (role-based login):

1. Select the category **Business roles | <Role class>**.
2. Select the business role in the result list.

3. Select one of the following tasks.
 - **Assign SharePoint Online groups**
 - **Assign SharePoint Online roles**
4. Assign the permissions in the **Add assignments** view.
- OR -
Remove the permissions in the **Remove assignments** area.
5. Save the changes.

Include SharePoint Online entitlements in system roles

Installed modules: System Roles Module

Use this task to add an entitlement to system roles. When you assign a system role to an employee, the entitlement is inherited by all user accounts of this employee.

NOTE: Groups with the option **Only use in IT Shop** can only be assigned to system roles that also have this option set. For more detailed information, see the *One Identity Manager System Roles Administration Guide*.

To assign a group to system roles:

1. Select one of the following categories.
 - **SharePoint Online | Groups**
 - **SharePoint Online | Roles**
2. Select the entitlements in the result list.
3. Select **Assign system roles**.
4. Assign system roles in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of system roles.

To remove an assignment

- Select the system role and double click .
5. Save the changes.

Adding SharePoint Online entitlements to IT Shop

When you assign a permission to a IT Shop shelf, it can be requested by the shop customers. To ensure it can be requested, further prerequisites need to be guaranteed.

- the permission must be marked with the **IT Shop** option.
- the permission must be assigned a service item.
 - ① **TIP:** In Web Portal, all products that can be requested are grouped together by service category. To make the permission easier to find in Web Portal, assign a service category to the service item.
- If you only want it to be possible for the permission to be assigned to employees through IT Shop requests, the permission must also be labeled with the **Use only in IT Shop** option. Direct assignment to hierarchical roles or user accounts is no longer permitted.
- ① **NOTE:** With role-based login, the IT Shop administrators can assign permissions to IT Shop shelves. Target system administrators are not authorized to add permissions to IT Shop.

To add a permission to IT Shop.

1. In Manager, select one of the following categories (non-role-based login).
 - **SharePoint Online | Groups**
 - **SharePoint Online | Roles**- OR -

In Manager select one of the following categories (role-based login).

 - **Entitlements | SharePoint Online Groups**
 - **Entitlements | SharePoint Online Roles**
2. In the result list, select the permission.
3. Select **Add to IT Shop**.
4. In **Add assignments**, the entitlement to the IT Shop shelves.
5. Save the changes.

To remove, an entitlement from individual shelves of the IT Shop

1. In Manager, select one of the following categories (non-role-based login).
 - **SharePoint Online | Groups**
 - **SharePoint Online | Roles**- OR -

In Manager select one of the following categories (role-based login).

- **Entitlements | SharePoint Online Groups**
- **Entitlements | SharePoint Online Roles**

2. In the result list, select the permission.
3. Select **Add to IT Shop**.
4. In **Remove assignments**, the entitlement from the IT Shop shelves.
5. Save the changes.

To remove, an entitlement from all shelves of the IT Shop

1. In Manager, select one of the following categories (non-role-based login).
 - **SharePoint Online | Groups**
 - **SharePoint Online | Roles**

- OR -

In Manager select one of the following categories (role-based login).

- **Entitlements | SharePoint Online Groups**
- **Entitlements | SharePoint Online Roles**

2. In the result list, select the group.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.

The group is removed from all shelves by the One Identity Manager Service. All requests and assignment requests with this group are canceled.

For detailed information about requesting company resources through IT Shop, see the *One Identity Manager IT Shop Administration Guide*.

Effectiveness of SharePoint Online entitlement assignments

Table 17: Configuration Parameter for Conditional Inheritance

| Configuration parameter | Effect when set |
|---|---|
| QER Structures Inherit GroupExclusion | Preprocessor relevant configuration parameter for controlling effectiveness of group memberships. If the parameter is set, memberships can be reduced on the basis of exclusion definitions. Changes to the parameter require recompiling the database. |

When groups are assigned to user accounts an employee may obtain two or more groups, which are not permitted in this combination. To prevent this, you can declare mutually exclusive groups. To do this, you specify which of the two groups should apply to the user accounts if both are assigned.

It is possible to assign an excluded group directly, indirectly or by IT Shop request at any time. One Identity Manager determines whether the assignment is effective.

NOTE:

- You cannot define a pair of mutually exclusive groups. That means, the definition "Group A excludes group B" AND "Group B excludes groups A" is not permitted.
- You must declare each group to be excluded from a group separately. Exclusion definitions cannot be inherited.

The effectiveness of the assignments is mapped in the 03SUserIn03SGroup and 03SBaseTreeHasGroup via the column XIsInEffect.

Example of the effect of group memberships

- Group A is assigned through the department "Marketing", group B through "Finance" and group C through the business role "Control group".

Clara Harris has a user account in this site collection. She primarily belongs to the department "marketing". The business role "Control group" and the department "Finance" are assigned to her secondarily. Without an exclusion definition, the user account obtains all the permissions of groups A, B and C.

By using suitable controls, you want to prevent an employee from obtaining authorizations of groups A and group B at the same time. That means, groups A, B and C are mutually exclusive. A user, who is a member of group C cannot be a member of group B at the same time. That means, groups B and C are mutually exclusive.

Table 18: Specifying excluded groups (table 03SGroupExclusionAADGroupExclusionCSMGroupExclusion))

| Effective Group | Excluded Group |
|-----------------|----------------|
| Group A | |
| Group B | Group A |
| Group C | Group B |

Table 19: Effective Assignments

| Employee | Member in Role | Effective Group |
|--------------|-----------------------------------|------------------|
| Ben King | Marketing | Group A |
| Jan Bloggs | Marketing, finance | Group B |
| Clara Harris | Marketing, finance, control group | Group C |
| Jenny Basset | Marketing, control group | Group A, Group C |

Only the group C assignment is in effect for Clara Harris. It is published in the target system. If Clara Harris leaves the business role "control group" at a later date, group B also takes effect.

The groups A and C are in effect for Jenny Basset because the groups are not defined as mutually exclusive. If this should not be allowed, define further exclusion for group C.

Table 20: Excluded groups and effective assignments

| Employee | Member in Role | Assigned Group | Excluded Group | Effective Group |
|--------------|----------------|----------------|--------------------|-----------------|
| Jenny Basset | Marketing | Group A | | Group C |
| | Control group | Group C | Group B Group A | |

Prerequisites

- The configuration parameter **QER | Structures | Inherit | GroupExclusion** is enabled.
- Mutually exclusive groups belong to the same site collection.

To exclude a group

1. In Manager, select **SharePoint Online | Groups**.
2. Select a group in the result list.
3. Select **Exclude groups**.
4. Assign the groups that are mutually exclusive to the selected group in **Add assignments**.
- OR -
In **Remove assignments**, remove the groups that are not longer mutually exclusive.
5. Save the changes.

SharePoint OnlineGroup inheritance based on categories

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can be freely selected and are specified using a mapping rule. Each category is given a specific

position within this mapping rule. The template contains two tables; the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions **Position 1** to **Position 31**.

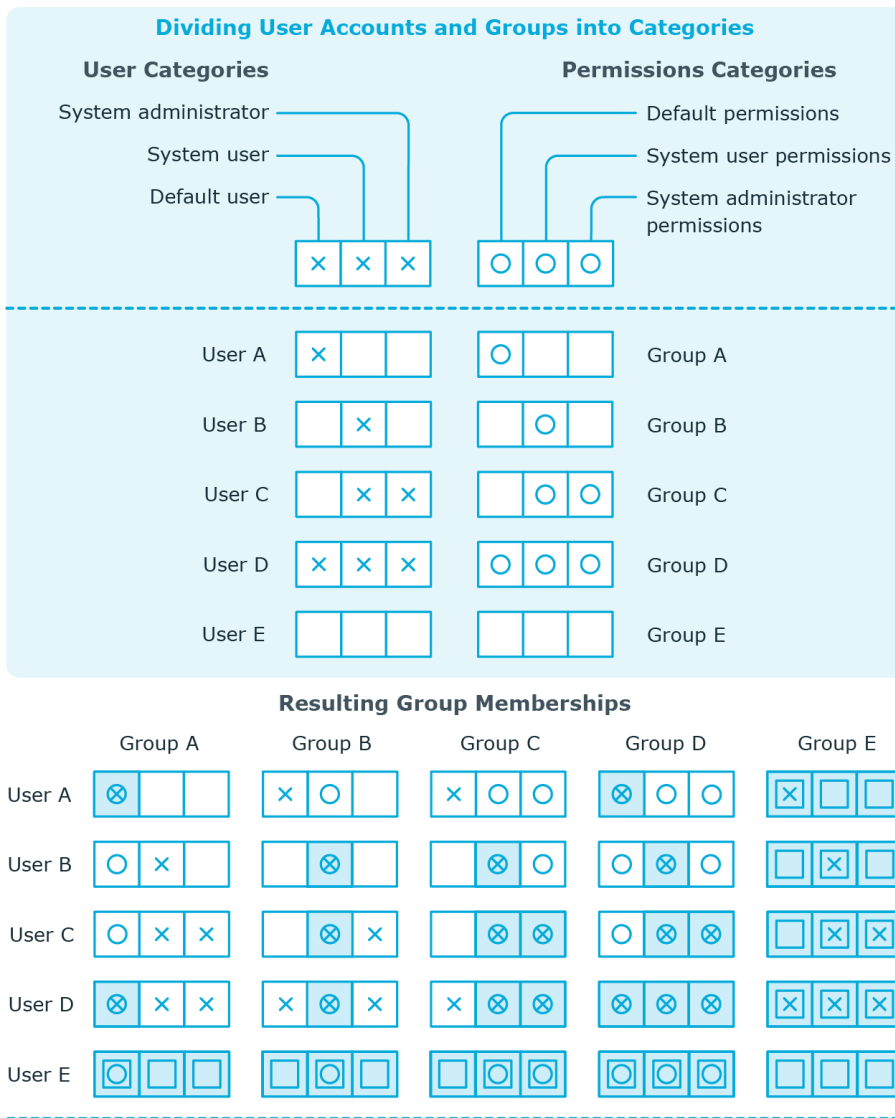

Every user account can be assigned to one or more categories. Each group can also be assigned to one or more categories. The group is inherited by the user account when at least one user account category item matches an assigned group. The group is also inherited by the user account if the group or the user account is not put into categories.

NOTE: Inheritance through categories is only taken into account when groups are assigned indirectly through hierarchical roles. Categories are not taken into account when groups are directly assigned to user accounts.

Table 21: Category Examples

| Category Position | Categories for User Accounts | Categories for Groups |
|--------------------------|-------------------------------------|----------------------------------|
| 1 | Default user | Default permissions |
| 2 | System user | System user permissions |
| 3 | System administrator | System administrator permissions |

Figure 2: Example of inheriting through categories.

Key:

| | |
|---|--|
| <p>⊗ Inherits due to matching categories</p> <p>□ Inherits because user account and group are not categorized</p> | <p>⊙ Inherits because user account is not categorized</p> <p>⊗ Inherits because group is not categorized</p> |
|---|--|

To use inheritance through categories

- Define the categories in the site collection.
- Assign categories to user accounts through their master data.
- Assign categories to groups through their master data.

Overview of all assignments

The **Overview of all assignments** report is displayed for some objects, such as authorizations, compliance rules, or roles. The report finds all the roles, for example, departments, cost centers, locations, business roles and IT Shop structures in which there are employee who own the selected base object. In this case, direct as well as indirect base object assignments are included.

Example

- If the report is created for a resource, all roles are determined in which there are employees with this resource.
- If the report is created for a group or another system entitlement, all roles are determined in which there are employees with this group or system entitlement.
- If the report is created for a compliance rule, all roles are determined in which there are employees with this compliance rule.
- If the report is created for a department, all roles are determined in which employees of the selected department are also members.
- If the report is created for a business role, all roles are determined in which employees of the selected business role are also members.

To display detailed information about assignments

- To display the report, select the base object from the navigation or the result list and select the report **Overview of all assignments**.
- Click the  **Used by** button in the report toolbar to select the role class for which you want to determine whether roles exist that contain employees with the selected base object.

All the roles of the selected role class are shown. The color coding of elements identifies the role in which there are employees with the selected base object. The meaning of the report control elements is explained in a separate legend. To access the legend, click the  icon in the report's toolbar.

- Double-click a control to show all child roles belonging to the selected role.
- By clicking the  button in a role's control, you display all employees in the role with the base object.

- Use the small arrow next to  to start a wizard that allows you to bookmark this list of employee for tracking. This creates a new business role to which the employees are assigned.

Figure 3: Toolbar of the Overview of all assignments report.

Table 22: Meaning of Icons in the Report Toolbar

| Icon | Meaning |
|---|---|
|  | Show the legend with the meaning of the report control elements |
|  | Saves the current report view as a graphic. |
|  | Selects the role class used to generate the report. |
|  | Displays all roles or only the affected roles. |

Mapping of SharePoint Online objects in One Identity Manager

You use One Identity Manager to manage all objects of the SharePoint Online that are required for the optimization of access control in the target system. These objects are imported into the One Identity Manager database during synchronization. You cannot display or edit their properties in the Manager.

Detailed information about this topic

- [SharePoint Online tenants](#)

SharePoint Online tenants

A SharePoint Online tenant is the base object of a SharePoint Online environment. It must have a direct relationship to an Azure Active Directory organization. There is only one tenant for each connected SharePoint Online system.

SharePoint Online tenants are required for the configuration of provisioning processes, the automatic assignment of employees to user accounts, and the inheritance of groups by user accounts via categories within a SharePoint Online.

i **NOTE:** SharePoint Online tenants cannot be created in One Identity Manager. The Synchronization Editor sets up the SharePoint Online tenant in the One Identity Manager database.

Defining categories for the inheritance of SharePoint Online groups

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can be freely selected and are specified using a mapping rule. Each category is given a specific position within this mapping rule. The template contains two tables; the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions **Position 1** to **Position 31**.

To define a category

1. In Manager, select the site collection in **SharePoint Online | Site collections**.
2. Select **Change master data**.
3. Switch to the **Mapping rule category** tab.
4. Extend the relevant roots of the user account table or group table.
5. Click  to enable category.
6. Enter a category name of your choice for user accounts and groups and in the login language used.
7. Save the changes.

Additional tasks for managing SharePoint Online tenant

After you have entered the master data, you can apply different tasks to it. The task view contains different forms with which you can run the following tasks.

| Task | Theme |
|--|---|
| Overview of SharePoint Online tenants | Overview of a SharePoint Online tenant on page 90 |
| Define Search Criteria for Employee Assignment | Editing search criteria for automatic employee assignment on page 57 |
| How to Edit a Synchronization Project | Editing the synchronization project for a SharePoint Online tenant on page 90 |
| Synchronize object | Synchronizing single objects |

Overview of a SharePoint Online tenant

To obtain an overview of a tenant

1. In Manager, select **SharePoint Online | Tenants**.
2. Select the tenant in the result list.
3. Select **SharePoint Online tenant overview**.

Editing the synchronization project for a SharePoint Online tenant

Synchronization projects in which a tenant is already used as a base object can also be opened via Manager. You can, for example, check the configuration or view the synchronization log in this mode. The Synchronization Editor is not started with its full functionality. You cannot run certain functions, such as, running synchronization or simulation, starting the target system browser and others.

NOTE: The Manager is locked for editing throughout. To edit objects in the Manager, close the Synchronization Editor.

To open an existing synchronization project in the Synchronization Editor:

1. Select **SharePoint Online | Tenants**.
2. Select the tenant in the result list. Select **Change master data**.
3. Select **Edit synchronization project...** from the task view.

SharePoint Online user accounts

SharePoint Online user accounts provide the information necessary for user authentication, such as, the authentication mode and login names. In addition, permissions of users in a site collection are specified in the user accounts.

Each SharePoint Online user account represents an object from an authentication system trusted by the SharePoint Online system. In SharePoint Online, the authentication system is Azure Active Directory. The target system, Azure Active Directory, must be administrated in One Identity Manager so that the object used for authentication on the SharePoint Online user account can be saved as the authentication object. This means the SharePoint Online user account permissions are mapped to employees managed in One Identity Manager. One Identity Manager makes it possible for you to obtain an overview of

all an employee's SharePoint Online access permissions. SharePoint Online permissions can be attested and checked for compliance. Employees can request or obtain the SharePoint Online permissions they requires through their memberships in hierarchical roles or through the Web Portal when appropriately configured.

By default, the following objects can be assigned as authentication objects in One Identity Manager.

- Azure Active Directory groups of type Security (AADGroup)
- Azure Active Directory user accounts (AADUser)

During synchronization, One Identity Manager tries to assign the matching authentication object using the login name.

A user account can be linked to an employee in One Identity Manager. You can also manage user accounts separately from employees.

- 1 **NOTE:** It is recommended to use account definitions to set up user accounts for company employees. In this case, some of the master data described in the following is mapped through templates from employee master data.
- 1 **NOTE:** If employees are to obtain their user accounts through account definitions, the employees must own a user account and obtain their IT operating data through assignment to a primary department, a primary location or a primary cost center.

Additional tasks for managing SharePoint Online user accounts

After you have entered the master data, you can apply different tasks to it. The task view contains different forms with which you can run the following tasks.

| Task | Theme |
|---|--|
| Overview of SharePoint Online user accounts | Overview of SharePoint Online user accounts on page 98 |
| Assigning extended properties assign group | Assigning extended properties on page 98 Assigning SharePoint Online entitlements directly to a user account on page 77 |
| Assign SharePoint Online roles | Assigning SharePoint Online entitlements directly to a user account on page 77 |
| Synchronize object | Synchronizing single objects |

Overview of SharePoint Online user accounts

To obtain an overview of a user account

1. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
2. Select the user account in the result list.
3. Select **SharePoint Online user account overview**.

Assigning extended properties

Extended properties are meta objects that cannot be mapped directly in One Identity Manager, for example, operating codes, cost codes or cost accounting areas.

To specify extended properties for a user account

1. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
2. Select the user account in the result list.

3. Select **Assign extended properties**.
4. Assign extended properties in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of extended properties.

To remove an assignment

- Select the extended property and double click .

5. Save the changes.

For detailed information about extended properties, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Deleting and restoring SharePoint Online user accounts

If a user account is deleted in One Identity Manager, it is initially marked for deletion. The user account is therefore locked. Depending on the deferred deletion setting, the user account is either deleted from the One Identity Manager database immediately, or at a later date.

NOTE: As long as an account definition for an employee is valid, the employee retains the user account that was created by it. If the assignment of an account definition is removed, the user account that was created from this account definition is deleted.

To delete a user account that is not managed using an account definition

1. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
2. Select the user account in the result list.
3. Click  to delete the user account.
4. Confirm the security prompt with **Yes**.

To restore a user account

1. In Manager, select **SharePoint Online | User accounts (user authenticated)**.
- OR -
In Manager, select **SharePoint Online | User accounts (group authenticated)**.
2. Select the user account in the result list.
3. Click  in the result list toolbar.

Configuring deferred deletion

By default, user accounts are finally deleted from the database after 30 days. You can reenable the user accounts until deferred deletion is run. After deferred deletion is run, the user account are deleted from the database and cannot be restored anymore. You can configure an alternative deletion delay in Designer using the 03SUser table.

SharePoint Online groups

You can use groups in SharePoint Online to provide users with the same permissions. Groups that you add for site collections are valid for all sites in that site collection. SharePoint Online roles that you define for a site are assigned directly to groups. All user accounts that are members of these groups obtain the permissions defined in the SharePoint Online roles for this site.

You can edit the following group data in the One Identity Manager:

- Object properties like display name, owner or visibility of memberships
- Assigned SharePoint Online role and user accounts
- Usage in the IT Shop
- Risk assessment
- Inheritance through roles and inheritance restrictions

Entering master data for SharePoint Online groups

Enter the following master data for a group.

Table 27: SharePoint Online Group Master Data

| Property | Description |
|-------------------------------------|--|
| Title | Display name of the group. |
| Site collection | Site collection the group is used in. |
| Owner | Owner of the group. A SharePoint Online user account or a SharePoint Online group can be selected. |
| Service item | Service item data for requesting the group through the IT Shop. |
| Risk index | Value for evaluating the risk of assigning the group to user accounts. Enter a value between 0 and 1. This input field is only visible if the configuration parameter QER CalculateRiskIndex is activated. |
| Category | Categories for group inheritance. Groups can be selectively inherited by user accounts. To do this, groups and user accounts are divided into categories. Select one or more categories from the menu. |
| Description | Spare text box for additional explanation. |
| Hidden | Specifies whether or not the group is displayed in the user interface. |
| Memberships only visible to members | Specifies whether only group members can see the list of members. |
| Group members can edit memberships | Specifies whether all group members can edit the group memberships. |
| Request for membership permitted | Specifies whether SharePoint Online users can request or end membership in these groups themselves. |
| Automatic membership on request | Specifies whether SharePoint Online users automatically become members in the group once they request membership. The same applies when user end their membership. |
| Email address membership requested | Email address that the group membership request or closure is sent to. |
| IT Shop | Specifies whether the group can be requested through the IT Shop. If this option is set, the group can be requested by the employees through the Web Portal and distributed with a defined approval process. The group can still be assigned directly to hierarchical roles. |
| Only for use | Specifies whether the group can only be requested through the IT Shop. If |

| Property | Description |
|------------|---|
| in IT Shop | this option is set, the group can be requested by the employees through the Web Portal and distributed with a defined approval process. Direct assignment of the group to hierarchical roles or user accounts is not permitted. |

Overview of SharePoint Online groups

Use this task to obtain an overview of the most important information about a group.

To obtain an overview of a group

1. Select the category **SharePoint Online | Groups**.
2. Select the group in the result list.
3. Select **SharePoint Online group overview** in the task view.

Assigning extended properties to a SharePoint Online group

Extended properties are meta objects that cannot be mapped directly in One Identity Manager, for example, operating codes, cost codes or cost accounting areas.

To specify extended properties for a group

1. In Manager, select **SharePoint Online | Groups**.
2. Select the group in the result list.
3. Select **Assign extended properties**.
4. Assign extended properties in **Add assignments**.

TIP: In the **Remove assignments** area, you can remove the assignment of extended properties.

To remove an assignment

- Select the extended property and double click .
5. Save the changes.

For more detailed information about setting up extended properties, see the *One Identity Manager Identity Management Base Module Administration Guide*.

Deleting SharePoint Online groups

To delete a group

1. In Manager, select **SharePoint Online | Groups**.
2. Select the group in the result list.
3. Click .
4. Confirm the security prompt with **Yes**.

The group is deleted completely from the One Identity Manager database and from SharePoint Online.

SharePoint Online permission levels

To assign permissions to the objects of a site collection and their child sites, permission levels are defined in SharePoint Online. These permission levels group together different permissions that are permanently defined in SharePoint Online.

General master data for SharePoint Online permission levels

Enter the following properties for a permission level on the master data form:

Table 28: General master data for a permission level

| Property | Description |
|------------------|--|
| Permission level | Name of the permissions level. |
| Site collection | Unique identifier for the site collection in which the permission level is created. |
| Permissions | SharePoint Online permissions that are assigned to the permission level. |
| Description | Spare text box for additional explanation. |
| Hidden | Specifies whether a SharePoint Online role with the permission level can be assigned to user accounts or groups. |

Additional tasks for managing SharePoint Online permission levels

After you have entered the master data, you can apply different tasks to it. The task view contains different forms with which you can run the following tasks.

To obtain an overview of a permission level

1. In Manager, select **SharePoint Online | Permission levels**.
2. Select the permission level in the result list.
3. Select **SharePoint Online permission level overview**.

Deleting SharePoint Online permission levels

You cannot delete SharePoint Online roles in the Manager. They are deleted by the DBQueue Processor when the associated permission level is deleted.

To delete a permission level

1. In Manager, select **SharePoint Online | Permission levels**.
2. Select the permission level in the result list.
3. Click  to delete the permission level.
4. Confirm the security prompt with **Yes**.

If deferred deletion is configured, the permission level is marked for deletion and finally deleted after the deferred deletion period has expired. During this period, the permission level can be restored. Permission levels with deferred deletion of 0 days are deleted immediately.

To restore a permission level

1. Select **SharePoint Online | Permission levels**.
2. Select the permission level marked for deletion in the result list.
3. Click  in the result list.

SharePoint Online site collections

Site collections and sites are mapped with their access rights to One Identity Manager. You cannot edit their properties in the One Identity Manager. You can edit access rights managed within a site collection in One Identity Manager. To do this, SharePoint Online roles, groups and user accounts are loaded into the One Identity Manager database.

A site collection groups sites together. User account and their access permissions are managed on the sites. To automatically assign used accounts and employees, assign an account definition to the site collection.

Authorized user accounts and groups are displayed on the site collection overview as well as the client and the root site linked to the site collection. The overview form also shows the quota template, and the site collection administrators assigned to the site collection.

To edit site collection properties

1. Select **SharePoint Online | Site collections**.
2. Select the site collection in the result list. Select **Change master data**.
3. Enter the required data on the master data form.
4. Save the changes.

General master data for a SharePoint Online site collection

The following properties are displayed for site collections.

NOTE: Only the account definition of the site collection can be edited.

Table 29: General master data for a site collection

| Property | Description |
|--------------------|---|
| Title | Title of the site collection. |
| Account definition | Initial account definition for creating user accounts. This account definition is used if automatic assignment of employees to user accounts is used for this site collection and if user accounts are to be created that are already managed (Linked configured). The account definition's default manage level is applied. User accounts are only linked to the employee (Linked) if no account definition is given. This is the case on initial synchronization, for example. |
| Tenant | Unique identifier of the Azure Active Directory tenant. |
| Root site | Link to the site collection root site. Links to a site that is set as root site . |
| Administrator | Administrator user account for the site collection. |
| Language | Name of the language culture, for example ES-es |
| Time zones | Unique identifier for the time zone. |
| Geolocation | Details of the geographical location. |
| Main version | The main version of this site collection for the purpose of compatibility checks at main version level. |

| Property | Description |
|------------------------------|--|
| Status information | Status of the site collection. |
| Site template | Unique ID of the SharePoint Online web template. |
| Used storage | Information about the storage taken up by the site collection on the server. |
| Used storage (%) | Percentage of storage space used. |
| Last content-relevant change | Time of last content-relevant change that was made to an object in this site collection. |

The URL and the URL of a portal linked to the site collection are displayed on the **Addresses** tab.

Related Topics

Address data for a SharePoint Online site collection

The following address data is mapped on **Addresses**.

Table 30: Address data for a site collection

| Properties | Description |
|------------------------|--|
| URL | Complete URL of the site collection. |
| URL relative to server | URL of the site collection relative to the server URL. |

If the server declared in the URL can be resolved by DNS, you can open the site in the default browser.

Specifying categories for inheriting SharePoint Online groups

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can

be freely selected and are specified using a mapping rule. Each category is given a specific position within this mapping rule. The template contains two tables; the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions **Position 1** to **Position 31**.

To define a category

1. In Manager, select the site collection in **SharePoint Online | Site collections**.
2. Select **Change master data**.
3. Switch to the **Mapping rule category** tab.
4. Extend the relevant roots of the user account table or group table.
5. Click  to enable category.
6. Enter a category name of your choice for user accounts and groups and in the login language used.
7. Save the changes.

- [SharePoint Online Group inheritance based on categories](#) on page 81

Additional tasks for managing site collections

After you have entered the master data, you can apply different tasks to it. The task view contains different forms with which you can run the following tasks.

| Task | Theme |
|---|--|
| Overview of the SharePoint Online site collection | Overview of a SharePoint Online site collection on page 111 |
| Define Search Criteria for Employee Assignment | Editing search criteria for automatic employee assignment on page 57 |
| Synchronize object | Synchronizing single objects |

You can view all the administrators permitted for this site collection on the overview form.

Related Topics

- [Address data for a site](#) on page 113

Overview of a SharePoint Online site collection

To view an overview of a site collection:

1. In Manager, select **SharePoint Online | Site collections**.
2. Select the user account in the result list.
3. Select **SharePoint Online site collection overview**.

Displaying SharePoint Online administrators for a site collection

The administrators for a site collection cannot be edited in One Identity Manager. However, you can still display the administrators.

To display administrators for a site collection

1. Select **SharePoint Online | Site collections**.
2. Select the customer in the result list.
3. Select **Assign administrators** in the task view.
4. Under **Add assignments** you can see all SharePoint Online Administrators.
- OR -
In the **Remove assignments** area, all assigned administrators are displayed.
5. Save the changes.

SharePoint Online sites

SharePoint Online sites are organized into site collections. A site collection manages access rights and characterization templates for all sites in the site collection. You can structure sites hierarchically. There is always a site labeled as **root site** in every site collection. The other sites in the site collection are sorted below the root site.

To edit site properties

1. In the Manager, select the category **SharePoint Online | Sites**.
2. Select the site in the result list. Select **Change master data**.
3. Enter the required data on the master data form.
4. Save the changes.

General Master Data for a Site

The following master data is displayed for sites.

Table 31: General Master Data for a Site

| Property | Description |
|-----------------------------------|---|
| Title | Display name of the site. |
| Created | Specifies when the site was created. |
| User interface version | Version of the user interface (UI) of the website. |
| Parent site | Unique ID for the parent site. |
| Site collection | Unique identifier for the site collection to which the site belongs. |
| SharePoint Online site collection | The parent site of the selected website. |
| Language | Name of the language culture, for example ES-es |
| Time zones | Unique identifier for the time zone. |
| Unique role assignments | Specifies whether user accounts and groups can be given direct permission for the website. If this option is not set, the role assignments are inherited from the parent site. No other user accounts or groups have permissions for this site. |
| Member group | Determines the users who have been assigned permissions for contributions to the website. |
| Owner group | The owner groups belonging to the site. |
| Visitor group | The visitor group belonging to the site. |
| Author | Link to user account that created the site. |
| Request access | E-mail address to which the access requests are sent. |

| Property | Description |
|----------------------------|--|
| email | |
| Description | Spare text box for additional explanation. |
| RSS feeds | Specifies whether RSS feeds are permitted on the site. |
| Contains confidential info | Specifies whether the site contains confidential information. |
| Multilingual | Information about whether a multilingual user interface is activated for the site. |

- [Managing the assignments of SharePoint Online groups and roles](#) on page 70

Address data for a site

The following address data is mapped on **Addresses**.

Table 32: Address data for a site

| Properties | Description |
|------------------------|---|
| URL relative to server | URL of the site relative to the server URL. |
| URL | Absolute site URL. |
| Master page URL | URL of the master page used for the site. |
| Alternative master URL | URL to an alternative master page referenced by the site. |

If the server declared in the URL can be resolved by DNS, you can open the site in the default browser.

Related Topics

Site design properties

The following design information is displayed on the **Design** tab.

Table 33: Site design properties

| Property | Description |
|-----------------------|--|
| Site template | Unique identifier for the site template to be used when the site is created. A value is only shown if you add the site through One Identity Manager. |
| URL for logo | URL for the site logo relative to the web application URL. |
| Logo icon description | Description of the site's logo. |

Additional tasks for managing sites

After you have entered the master data, you can apply different tasks to it. The task view contains different forms with which you can run the following tasks.

You can view all the roles and permission levels that are valid for this site on the overview form. Use **Open URL** to open the site in a standard web browser. Prerequisite for this is that the server in the URL can be resolved per DNS.

To obtain an overview of an site

1. In the Manager, select the category **SharePoint Online | Sites**.
2. Select the site in the result list.
3. Select **SharePoint Online site overview**.

If the server declared in the URL can be resolved by DNS, you can open the site in the default browser.

To open the site

1. Select **SharePoint Online | Site collections**.
2. Select the site in the result list.
3. Select **Open URL**.

- [Address data for a site](#) on page 113

Passing on permissions to child sites

SharePoint Online roles are defined at site level. There are always roles defined for the root site of a site collection. Child sites can inherit these role definitions. In the same way, roles on the root site of a site collection are also assigned to groups or user accounts.

These assignments can inherit child sites. **Unique role assignment** specifies whether user accounts and groups are explicitly authorized for a site or whether the role assignments are inherited by the parent website.

Child sites can inherit permissions from the sites that the user accounts have on those sites. Every root site of a site collection or every site that has a child site. This permits the following scenarios:

1. The child site inherits the role assignments.
The permission levels and role definitions of the parent site apply. User and groups cannot be explicitly authorized for the site. Only user accounts that have permissions for the parent (inheritance) site have access to the site.
2. The child site does not inherit role assignments.
In this case unique permission levels can be created in the same way as the root site of a site collection. The SharePoint Online roles based on the definitions are assigned to user accounts and groups.

Related Topics

- [General Master Data for a Site](#) on page 112

SharePoint Online roles

Permission levels with a unique reference to a site are mapped in the One Identity Manager database as SharePoint Online roles. You can assign SharePoint Online roles through groups, or directly to user accounts. SharePoint Online users obtain their permissions for site objects in this way.

NOTE: SharePoint Online roles and role assignments are handled as dependent objects by synchronization. That means, SharePoint Online roles must also be synchronized in order to synchronize role assignments.

Related Topics

- [SharePoint Online permission levels](#) on page 105

Changing master data for SharePoint Online roles

To edit SharePoint Online role master data

1. In the Manager, select the category **SharePoint Online | Roles**.
2. Select the SharePoint Online role in the result list and run the **Change master data** task.
3. Edit the master data for the role.
4. Save the changes.

NOTE: If the SharePoint Online role references a permission level for which the **Hidden** option is set, the options **IT Shop** and **Only use in IT Shop** cannot be set. You cannot assign these SharePoint Online roles to user accounts or groups.

Detailed information about this topic

General master data for SharePoint Online roles

The following properties are displayed for SharePoint Online roles.

Table 34: General master data for a SharePoint Online role

| Property | Description |
|------------------|---|
| Display name | SharePoint Online role display name. |
| Permission level | Unique identifier for the permission level on which the SharePoint Online role is based. |
| Site | Unique identifier for the site that inherits its permissions from the SharePoint Online role. |
| Service item | Service item data for requesting the role through the IT Shop. |
| Category | Categories for role inheritance. User accounts can inherit roles selectively. To do this, roles and user accounts are divided into categories. Select one or more categories from the menu. |
| Description | Spare text box for additional explanation. |

| Property | Description |
|-------------------------|--|
| IT Shop | Specifies whether the SharePoint Online role can be requested through the IT Shop. This SharePoint Online role can be requested by staff through the Web Portal and granted through a defined approval procedure. The SharePoint Online role can still be assigned directly to employees and hierarchical roles. |
| Only for use in IT Shop | Specifies whether the SharePoint Online role can only be requested through the IT Shop. This SharePoint Online role can be requested by staff through the Web Portal and granted through a defined approval procedure. The SharePoint Online role may not assigned directly to hierarchical roles. |

NOTE: If the SharePoint Online role references a permission level for which the **Hidden** option is set, the options **IT Shop** and **Only use in IT Shop** cannot be set. You cannot assign these SharePoint Online roles to user accounts or groups.

Detailed information about this topic

- [General master data for SharePoint Online permission levels](#) on page 106

Additional tasks for managing SharePoint Online roles

After you have entered the master data, you can apply different tasks to it. The task view contains different forms with which you can run the following tasks.

| Task | Theme |
|--------------------------------------|--|
| Overview of SharePoint Online Groups | Overview of SharePoint Online roles on page 118 |
| assign user accounts | Assigning SharePoint Online user accounts directly to an entitlement on page 76 |
| assign group | Assigning SharePoint Online groups to SharePoint Online roles on page 78 |
| Assign system roles | Include SharePoint Online entitlements in system roles on page 74 |
| Assign business roles | Assigning SharePoint Online permissions to business roles on page 73 |
| Assign organizations | Assigning SharePoint Online permissions to departments, cost centers, and locations on page 72 |

| Task | Theme |
|---------------------------------|--|
| SharePoint Online Exclude roles | Effectiveness of SharePoint Online roles on page 118 |
| Assigning extended properties | Assigning extended properties to a SharePoint Online group on page 104 |
| Synchronize object | Synchronizing single objects |

Overview of SharePoint Online roles

To obtain an overview of a role

1. In Manager, select **SharePoint Online | Roles**.
2. Select the role in the result list.
3. Select **SharePoint Online role overview**.

Effectiveness of SharePoint Online roles

The behavior described under [Effectiveness of SharePoint Online entitlement assignments](#) on page 79 can also be used for SharePoint Online roles.

The effect of the assignments is mapped in the tables `03UserHas03SRLAssign` and `BaseTreeHas03SRLAssign` through the `XIsInEffect` column.

Prerequisites

- The configuration parameter **QER | Structures | Inherit | GroupExclusion** is enabled.
- Mutually exclusive SharePoint Online roles belong to the same site collection.

To exclude SharePoint Online roles

1. In the Manager, select the category **SharePoint Online | Roles**.
2. Select the role in the result list.
3. In the task view, select **Exclude SharePoint Online roles**.
4. Assign the roles that are mutually exclusive to the selected role in **Add assignments**.
- OR -
In the **Remove assignments** view, remove the roles that no longer exclude each other.
5. Save the changes.

Detailed information about this topic

Handling of SharePoint Online objects in Web Portal

One Identity Manager enables its users to perform various tasks simply using a Web Portal.

- Managing user accounts and employees

An account definition can be requested by shop customers in Web Portal when it is assigned to an IT Shop shelf. The request undergoes a defined approval procedure. The user account is not created until it has been agreed by an authorized person, such as a manager.

- Attestation

To enable this, attestation policies are configured in Manager. The attesters use the Web Portal to approve attestation cases.

- Governance Administration

The rules are checked regularly, and if changes are made to the objects in One Identity Manager. Compliance rules are defined in Manager. Supervisors use the Web Portal to check and resolve rule violations and to grant exception approvals.

If the Company Policies Module is available, company policies can be defined for the target system objects mapped in One Identity Manager and their risks evaluated. Company policies are defined in Manager. Supervisors use the Web Portal to check policy violations and to grant exception approvals.

- Risk assessment

The One Identity Manager provides default calculation functions for this. The calculation functions can be modified in the Web Portal.

- Reports and statistics

Basic data for managing a SharePoint Online environment

To manage a SharePoint Online environment in One Identity Manager, the following basic data is relevant.

- Authentication Modes

Authentication mode used for logging in to the SharePoint Online server with this user account.

For more information, see [SharePoint Online authentication modes](#) on page 122.

- Target system types.

Target system types are required for configuring target system comparisons. Tables containing outstanding objects are maintained on target system types.

For more information, see [Post-processing outstanding objects](#) on page 33.

- Account definitions

One Identity Manager has account definitions for automatically allocating user accounts to employees during working hours. You can create account definitions for every target system. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee.

For more information, see [Account definitions for SharePoint Online user accounts](#) on page 37.

- Server.

In order to handle SharePoint Online -specific processes in One Identity Manager, the synchronization server and its server functions must be declared.

For more information, see [Job server for SharePoint Online-specific process handling](#) on page 122.

- Target system managers.

A default application role exists for the target system manager in One Identity Manager. Assign the employees who are authorized to edit all tenants in One Identity Manager to this application role.

Define additional application roles if you want to limit the edit permissions for target system managers to individual tenants. The application roles must be added under the default application role.

For more information, see [Target system managers](#) on page 127.

SharePoint Online authentication modes

The following master data is supplied for the authentication mode.

Table 35: Authentication mode properties

| Property | Description |
|-----------------------|--|
| System ID | Name of the authentication mode. For SharePoint Online, AzureAD is the only authentication mode. |
| User prefix | Prefix for formatting a login name for new user accounts. The associated authentication object is not a group. This means, the user account option Group is not set. |
| Group prefix | Prefix for formatting a login name for new user accounts. The associated authentication object is a group. This means, the user account option Group is set. |
| Column for login name | Column in the table Person used to format the login name for new user accounts. This information is required if employees are linked to user accounts through automatic employee assignment. |

Job server for SharePoint Online-specific process handling

In order to handle SharePoint Online -specific processes in One Identity Manager, the synchronization server and its server functions must be declared. You have several options for defining a server's functionality:

- Create an entry for the Job server in Designer under **Base Data | Installation | Job server**. For detailed information, see the *One Identity Manager Configuration Guide*.
- Select an entry for the Job server in **SharePoint Online | Basic configuration data | Server** in Manager and edit the Job server master data.

Use this task if the Job server has already been declared in One Identity Manager and you want to configure special functions for the Job server.

To edit a Job server and its functions

1. In Manager, select the category **SharePoint Online | Basic configuration data | Server**.
2. Select the Job server entry in the result list.
3. Select **Change master data**.
4. Edit the Job server's master data.
5. Select **Assign server functions** in the task view and specify server functionality.
6. Save the changes.

Editing servers

To edit a Job server and its functions

1. In Manager, select the category **SharePoint Online | Basic configuration data | Server**.
2. Select the Job server entry in the result list.
3. Select **Change master data**.
4. Edit the Job server's master data.
5. Select **Assign server functions** in the task view and specify server functionality.
6. Save the changes.

Detailed information about this topic

- [Master data for a Job server](#) on page 123
- [Specifying server functions](#) on page 125

Master data for a Job server

NOTE: All editing options are also available in Designer under **Base Data | Installation | Job server**.

NOTE: More properties may be available depending on which modules are installed.

Table 36: Job Server Properties

| Property | Meaning |
|------------------------------|---|
| Server | Job server name. |
| Full server name | Full server name in accordance with DNS syntax. Example: <Name of servers>.<Fully qualified domain name> |
| Server is cluster | Specifies whether the server maps a cluster. |
| Server belongs to cluster | Cluster to which the server belongs. NOTE: The properties Server is cluster and Server belongs to cluster are mutually exclusive. |
| IP address (IPv6) | Internet protocol version 6 (IPv6) server address. |
| IP address (IPv4) | Internet protocol version 4 (IPv4) server address. |
| Copy process (target server) | Permitted copying methods that can be used when this server is the destination of a copy action. |
| Coding | Character set coding that is used to write files to the server. |
| Parent Job server | Name of the parent Job server. |
| Executing server | Name of the executing server. The name of the server that exists physically and where the processes are handled. This input is evaluated when One Identity Manager Service is automatically updated. If the server is handling several queues the process steps are not supplied until all the queues that are being processed on the same server have completed their automatic update. |
| Queue | Name of the queue to handle the process steps. Each One Identity Manager Service within the network must have a unique queue identifier. The process steps are requested by the job queue using exactly this queue name. The queue identifier is entered in the One Identity Manager Service configuration file. |

| Property | Meaning |
|--|---|
| Server operating system | Operating system of the server. This input is required to resolve the path name for replicating software profiles. The values Win32 , Windows , Linux and Unix are permitted. If no value is specified, Win32 is used. |
| Service account data | One Identity Manager Service user account information. In order to replicate between non-trusted systems (non-trusted domains, Linux server) the One Identity Manager Service user information has to be declared for the servers in the database. This means that the service account, the service account domain and the service account password have to be entered for the server. |
| One Identity Manager Service installed | Specifies whether a One Identity Manager Service is installed on this server. This option is enabled by the procedure QBM_PJobQueueLoad the moment the queue is called for the first time. The option is not automatically removed. If necessary, you can reset this option manually for servers whose queue is no longer enabled. |
| Stop One Identity Manager Service | Specifies whether the One Identity Manager Service has stopped. If this option is set for the Job server, the One Identity Manager Service does not process any more tasks. You can make the service start and stop with the appropriate administrative permissions in the program "Job Queue Info". For more detailed information, see the <i>One Identity Manager Process Monitoring and Troubleshooting Guide</i> . |
| No automatic software update | Specifies whether to exclude the server from automatic software updating. i NOTE: Servers must be manually updated if this option is set. |
| Software update running | Specifies whether a software update is currently being executed. |
| Server function | Server functionality in One Identity Manager. One Identity Manager processes are handled depending on the server function. |

Related Topics

- [Specifying server functions](#) on page 125

Specifying server functions

i | **NOTE:** All editing options are also available in Designer under **Base Data | Installation | Job server**.

The server function defines the functionality of a server in One Identity Manager. One Identity Manager processes are handled depending on the server function.

NOTE: More server functions may be available depending on which modules are installed.

Table 37: Permitted server functions

| Server function | Remark |
|--|--|
| Azure Active Directory connector (via Microsoft Graph) | Server on which the Azure Active Directory connector is installed. This server executes synchronization with the target system Azure Active Directory. |
| CSV connector | Server on which the CSV connector for synchronization is installed. |
| Domain controller | The Active Directory domain controller. Servers that are not labeled as domain controller are considered to be member servers. |
| Printer server | Server which acts as a print server. |
| Generic server | Server for generic synchronization with a custom target system. |
| Home server | Server for adding home directories for user accounts. |
| Update Server | <p>This server executes automatic software updating of all other servers. The server requires a direct connection to the database server that One Identity Manager database is installed on. The server can execute SQL tasks.</p> <p>The server with the installed One Identity Manager database, is labeled with this functionality during initial installation of the schema.</p> |
| SQL processing server | The server can execute SQL tasks. Several SQL processing servers can be set up to spread the load of SQL processes. The system distributes the generated SQL processes throughout all the Job servers with this server function. |
| CSV script server | The server can process CSV files using the ScriptComponent process component. |
| Native database connector | The server can connect to an ADO.Net database. |
| One Identity Manager database connector | Server on which the One Identity Manager connector is installed. This server executes synchronization with the target system One Identity Manager. |
| One Identity Manager Service installed | Server on which a One Identity Manager Service is installed. |

| Server function | Remark |
|------------------------------|---|
| Primary domain controller | Primary domain controller. |
| Profile server | Server for setting up profile directories for user accounts. |
| SAM synchronization Server | Server for running synchronization with an SMB-based target system. |
| SharePoint Online connector | Server on which the SharePoint Online connector is installed. This server executes synchronization with the target system SharePoint Online. |
| SMTP host | Server from which One Identity Manager Service sends email notifications. Prerequisite for sending mails using One Identity Manager Service is SMTP host configuration. |
| Default report server | Server on which reports are generated. |
| Windows PowerShell connector | The server can run Windows PowerShell version 3.0 or later. |
| SCIM connector | The server can connect to a cloud application. |

Target system managers

A default application role exists for the target system manager in One Identity Manager. Assign the employees who are authorized to edit all tenants in One Identity Manager to this application role.

Define additional application roles if you want to limit the edit permissions for target system managers to individual tenants. The application roles must be added under the default application role.

For detailed information about implementing and editing application roles, see the *One Identity Manager Authorization and Authentication Guide*.

Implementing application roles for target system managers

1. The One Identity Manager administrator assigns employees to be target system managers.
2. These target system managers add employees to the default application role for target system managers.

Target system managers with the default application role are authorized to edit all tenants in One Identity Manager.

3. Target system managers can authorize other employees within their area of responsibility as target system managers and if necessary, create additional child application roles and assign these to individual tenants.

Table 38: Default Application Roles for Target System Managers

| Users | Tasks |
|------------------------|--|
| target system managers | <p>Target system managers must be assigned to Target systems SharePoint Online or a sub-application role.</p> <p>Users with this application role:</p> <ul style="list-style-type: none">• Assume administrative tasks for the target system.• Create, change or delete target system objects, like user accounts or groups.• Edit password policies for the target system.• Prepare groups for adding to the IT Shop.• Can create employees with an identity that differs from the Primary identity.• Configure synchronization in the Synchronization Editor and defines the mapping for comparing target systems and One Identity Manager.• Edit the synchronization's target system types and outstanding objects.• Authorize other employees within their area of responsibility as target system managers and create child application roles if required. |

To initially specify employees to be target system administrators

1. Log in to One Identity Manager as Manager administrator (**Base role | Administrators**)
2. Select **One Identity Manager Administration | Target systems | Administrators**.
3. Select **Assign employees**.
4. Assign the employee you want and save the changes.

To add the first employees to the default application as target system managers.

1. Log yourself into Manager as target system administrator (**Target systems | Administrators**).
2. Select **One Identity Manager Administration | Target systems | SharePoint Online**.
3. Select **Assign employees** in the task view.
4. Assign the employees you want and save the changes.

To authorize other employees as target system managers when you are a target system manager

1. Login to Manager as target system manager.
2. Select the application role in SharePoint Online | **Basic configuration data | Target system managers**.
3. Select **Assign employees**.
4. Assign the employees you want and save the changes.

To specify target system managers for individual clients

1. Login to Manager as target system manager.
2. Select the category **SharePoint Online | Tenants**.
3. Select the client from the result list.
4. Select **Change master data**.
5. On the **General** tab, select the application role in the **Target system manager** menu.

- OR -

Next to the **Target system manager** menu, click  to create a new application role.

- a. Enter the application role name and assign the **Target systems | SharePoint Online** parent application role.
 - b. Click **OK** to add the new application role.
6. Save the changes.
 7. Assign employees to this application role who are permitted to edit the client in One Identity Manager.

Appendix: Configuration parameters for managing SharePoint Online

The following configuration parameters are additionally available in One Identity Manager after the module has been installed.

Table 39: Configuration parameters

| Configuration parameters | Meaning |
|--|--|
| TargetSystem SharePointOnline | Preprocessor relevant configuration parameter for controlling the database model components for the administration of the target system SharePoint Online. If the parameter is set, the target system components are available. Changes to the parameter require recompiling the database. |
| TargetSystem SharePointOnline Accounts | Parameter for configuring SharePoint Online user account data. |
| TargetSystem SharePointOnline Accounts MailTemplateDefaultValues | This configuration parameter contains the mail template used to send notifications if default IT operating data mapping values are used for automatically creating a user account. The Employee - new user account with default properties created mail template is used. |
| TargetSystem SharePointOnline DefaultAddress | The configuration parameter contains the recipient's default email address for sending notifications about actions in the target system. |
| TargetSystem SharePointOnline MaxFullsyncDuration | This configuration parameter contains the maximum runtime for synchronization. No recalculation of group memberships by the DBQueue Processor can take place during this time. If the maximum runtime is exceeded, group membership are recalculated. |
| TargetSystem | This configuration parameter specifies the mode for |

Configuration parameters**Meaning**

SharePointOnline |
PersonAutoDefault

automatic employee assignment for user accounts added to the database outside synchronization.

TargetSystem |
SharePointOnline |
PersonAutoFullsync

This configuration parameter specifies the mode for automatic employee assignment for user accounts added to or updated in the database through synchronization.

Appendix: Default project template for SharePoint Online

A default project template ensures that all required information is added in One Identity Manager. This includes mappings, workflows and the synchronization base object. If you do not use a default project template you must declare the synchronization base object in One Identity Manager yourself.

Use a default project template for initially setting up the synchronization project. For custom implementations, you can extend the synchronization project with the Synchronization Editor.

For the synchronization of user accounts and permissions of a SharePoint Online, you use the project template **SharePoint Onlinesynchronization**. The template uses mappings for the following schema types.

Table 40: Mapping SharePoint Online schema types to tables in the One Identity Manager schema.

| Schema type in SharePoint Online | Table in the One Identity Manager Schema |
|----------------------------------|--|
| Tenant | O3STenant |
| Site | O3SSite |
| Group | O3SGroup |
| Web | O3SWeb |
| RoleAssignment | O3SRLAsgn |
| RoleDefinition | O3SRole |
| User | O3SUser |

NOTE: There is only one synchronization template in the One Identity Manager for the target system SharePoint Online.

Appendix: Editing system objects

The following table describes permitted editing methods for SharePoint Online schema types and names restrictions on editing system objects in the Manager.

Table 41: Methods available for editing objects types

| Type | Read | Add | Delete | Change |
|-----------------|------|-----|--------|--------|
| Tenant | Yes | No | No | No |
| Site collection | Yes | No | No | No |
| User account | Yes | Yes | Yes | Yes |
| Group | Yes | Yes | Yes | Yes |
| Site | Yes | No | No | Yes |
| Role | Yes | Yes | Yes | Yes |
| Role assignment | Yes | No | No | Yes |

One Identity solutions eliminate the complexities and time-consuming processes often required to govern identities, manage privileged accounts and control access. Our solutions enhance business agility while addressing your IAM challenges with on-premises, cloud and hybrid environments.
