Managing SharePoint environments

In One Identity Manager, components and access rights from SharePoint 2010, SharePoint 2013, SharePoint 2016 and SharePoint 2019 can be mapped. The aim of this is to guarantee company employees access to the SharePoint site. To achieve this, information about the following SharePoint components is loaded into the One Identity Manager database.

- The farm, as the top level of the logical architecture in the SharePoint environment
  The SharePoint farm is set up as the base object for synchronization in the One Identity Manager database.
- All web applications set up inside the farm with their user policies and permitted permissions
- All site collections for these web applications with their user accounts and groups
- All sites added in site collections in a hierarchical structure (but not their content)
- All permission levels and SharePoint roles that define permissions for individual sites

SharePoint roles, groups and user accounts are mapped in the context of the SharePoint components for which they are set up. In the One Identity Manager, these objects provide SharePoint users with access permissions to the different websites. For that, you can use the different One Identity Manager mechanisms for linking employees with their SharePoint user accounts. The following objects are provisioned:

- SharePoint user accounts and their relations to SharePoint roles and groups
- SharePoint groups and their assignments to user accounts and roles
- SharePoint roles and their site permissions

To log into the SharePoint server, One Identity Manager supports classic Windows authentication as well as claims-based authentication. Every SharePoint user account that can log in with classic Windows authentication, is assigned either an Active Directory or an LDAP user account or an Active Directory or LDAP group in One Identity Manager. Login requires that the associated Active Directory or LDAP systems are also mapped in the One Identity Manager database. You can maintain information in One Identity Manager about authentication systems used by the SharePoint environment.

For every SharePoint user account connected to an Active Directory or LDAP user account, an additional employee defined in the One Identity Manager database can also be assigned. This makes it possible to maintain employee memberships in SharePoint roles and groups. Employees can inherit SharePoint permissions by assigning SharePoint roles
and groups to the organizational units. It is also possible to request permissions through the IT Shop. Permissions assigned to an employee can be monitored over compliance rules.

The SharePoint Module module is based on the SharePoint Foundation 2010, 2013, 2016 and 2019 class libraries respectively.

**Architecture overview**

The SharePoint connector is used for synchronization and provisioning SharePoint. The connector communicates directly with a SharePoint farm’s SharePoint servers.

**Figure 1: Connector Paths for Communicating with SharePoint**

The One Identity Manager Service, SharePoint connector, and the Synchronization Editor must be installed on one of the SharePoint farm’s servers. This server is known as the synchronization server in the following. All One Identity Manager Service actions are executed against the target system environment on the synchronization server. Data entries required for synchronization and administration with the One Identity Manager database are processed by the synchronization server.
Detailed information about this topic

- Setting up the synchronization server on page 14

One Identity Manager Users for managing a SharePoint system

The following users are used in SharePoint system administration with One Identity Manager.

Table 1: Users

<table>
<thead>
<tr>
<th>Users</th>

<td>Assign system entitlements to business roles.</td>
</tr>
</tbody>
</table>

**Claims-based authentication**

One Identity Manager supports claims-based authentication as well as classical Windows authentication for logging on to the SharePoint server. Information about the SharePoint provider and authentication modes are stored in the database for this purpose. Existing SharePoint providers for claims-based authentication are loaded into the database during synchronization. Registered providers are stored for each web application.

Every user account stores which authentication mode the user with this user account uses to log in. The default authentication mode depends on whether claims-based authentication is permitted with the associated web applications.

The authentication mode is required to add user accounts to One Identity Manager. The user account login name for claims-based authentication contains a prefix that depends on which authentication mode is used. These prefixes are maintained with the authentication modes.

**Related topics**

Setting up SharePoint farm synchronization

To initially load SharePoint objects into the One Identity Manager database

1. Prepare a user account with sufficient permissions for synchronizing in SharePoint.

2. One Identity Manager parts for managing SharePoint systems are available if "TargetSystem\SharePoint" is set.
   - Check whether the configuration parameter is set in the Designer. Otherwise, set the configuration parameter and compile the database.
   - Other configuration parameters are installed when the module is installed. Check the configuration parameters and modify them as necessary to suit your requirements.

3. Install and configure a synchronization server and declare the server as Job server in One Identity Manager.

4. Synchronize the Active Directory or LDAP environment, SharePoint is going to run on.
   - For more detailed information about synchronizing with Active Directory, see the One Identity Manager Administration Guide for Connecting to Active Directory. For more detailed information about synchronizing with LDAP, see the One Identity Manager Administration Guide for Connecting to LDAP.

   **IMPORTANT:** To prevent inconsistent data, the Active Directory or LDAP environment on which the SharePoint environment is based must always be synchronized first. Once this synchronization has been successfully completed you can start the SharePoint farm synchronization.

   If you cannot ensure synchronization, define custom processes for connecting SharePoint user accounts and user policies with the corresponding authentication objects.

5. Create a synchronization project with the Synchronization Editor.

**NOTE:** To create a synchronization project, start the Synchronization Editor on the synchronization server or a remote server. For more detailed information about the archiving process, see the One Identity Manager Target System Synchronization Reference Guide.
Detailed information about this topic

- Users and permissions for synchronizing with a SharePoint farm on page 13
- Setting up the synchronization server on page 14
- Creating a synchronization project for initial synchronization of a SharePoint farm on page 17
- Appendix: Configuration parameters for managing SharePoint environments on page 136

**Users and permissions for synchronizing with a SharePoint farm**

The following users are involved in synchronizing One Identity Manager with SharePoint.

**Table 2: Users for synchronization**

<table>
<thead>
<tr>
<th>Users</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>User for accessing the SharePoint farm</td>
<td>The connector uses the server farm account to log in to the SharePoint farm during synchronization. Ensure the server farm account login data is available. There is no sensible minimum configuration recommended, which effectively differentiates its permissions from the server account. Membership of the &quot;Farm Administrators&quot; group alone is not sufficient.</td>
</tr>
<tr>
<td>One Identity Manager Service user account</td>
<td>The One Identity Manager Service farm's server farm account must be used as user account for SharePoint. The user account for One Identity Manager Service requires additional rights to carry out operations at file level, for example, assigning user rights and creating and editing directories and files. The user account must belong to the <strong>Domain users</strong> group. The user account must have the <strong>Login as a service</strong> extended user right. The user account requires access rights to the internal web service.</td>
</tr>
</tbody>
</table>

**NOTE:** If One Identity Manager Service runs under the network service (**NT Authority\NetworkService**), you can issue access rights for the internal web service with the following command line call:

```
netsh http add urlacl url=http://<IP address>:<port number>/user="NT AUTHORITY\NETWORKSERVICE"
```
### Users

<table>
<thead>
<tr>
<th>Users</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The user account needs full access to the One Identity Manager Service installation directory in order to automatically update the One Identity Manager.</td>
<td></td>
</tr>
<tr>
<td>In the default installation the One Identity Manager is installed under:</td>
<td></td>
</tr>
<tr>
<td>• %ProgramFiles(x86)%\One Identity (on 32-bit operating systems)</td>
<td></td>
</tr>
<tr>
<td>• %ProgramFiles%\One Identity (on 64-bit operating systems)</td>

</tbody>
</table>

### Permissions

<table>
<thead>
<tr>
<th></th>
<th>The Synchronization default system user is provided for executing synchronization with an application server.</th>
</tr>
</thead>
<tbody>
<tr>
<td>User for accessing the One Identity Manager database</td>
<td></td>
</tr>
</tbody>
</table>

### Setting up the synchronization server

You will need a synchronization server to synchronize a SharePoint environment. You can use any SharePoint farm SharePoint server for this. The following software must to be installed on the synchronization server.

**NOTE:** You must never use the same synchronization server to run synchronization projects in parallel. Different synchronization servers must never run synchronization projects for the same SharePoint farm in parallel.

If you distribute synchronization of a SharePoint farm over different start up configurations, ensure that they are run in sequence. For detailed information about setting up start up configurations, see the *One Identity Manager Target System Synchronization Reference Guide*. For more information, see Customizing synchronization configuration on page 25.

### To synchronize a SharePoint 2010 environment

- Microsoft SharePoint Server 2010
- Microsoft .NET Framework Version 4.7.2 or later

**NOTE:** Take the target system manufacturer's recommendations into account.

- One Identity Manager Service, SharePoint connector
  - Install One Identity Manager components with the installation wizard.
    1. Select **Select installation modules with existing database**.
    2. Select the machine role **Server | Job server | SharePoint**.
To synchronize SharePoint 2013, 2016, or 2019 environments

- Windows Server 2008 R2 or Windows Server 2012
- Microsoft SharePoint Server 2013, 2016 or 2019 respectively
- Microsoft .NET Framework Version 4.7.2 or later

**NOTE:** Take the target system manufacturer’s recommendations into account.

- One Identity Manager Service, SharePoint connector
  - Install One Identity Manager components with the installation wizard.
    1. Select **select installation modules with existing database.**
    2. Select the machine role **Server | Job server | SharePoint.**

All One Identity Manager Service actions are executed against the target system environment on the synchronization server. Data entries required for synchronization and administration with the One Identity Manager database are processed by the synchronization server. The synchronization server must be declared as a Job server in One Identity Manager.

Use the One Identity Manager Service to install the Server Installer. The program executes the following steps:

- Setting up a Job server.
- Specifying machine roles and server function for the Job server.
- Remote installation of One Identity Manager Service components corresponding to the machine roles.
- Configuration of One Identity Manager Service.
- Starts the One Identity Manager Service.

**NOTE:** The program executes remote installation of the One Identity Manager Service. Local installation of the service is not possible with this program. Remote installation is only supported within a domain or a trusted domain.

For remote installation of One Identity Manager Service, you require an administrative workstation on which the One Identity Manager components are installed. For detailed information about installing a workstation, see the One Identity Manager Installation Guide.

**To install and configure One Identity Manager Service remotely on a server**

1. Start the program Server Installer on your administrative workstation.
2. Enter the valid connection credentials for the One Identity Manager database on the **Database connection** page.
3. Specify the server on which you want to install One Identity Manager Service on the **Server properties** page.
   a. Select a Job server from the **Server** menu.
      - OR -
To create a new Job server, click **Add**.

b. Enter the following data for the Job server.

**Table 3: Job server properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Job server name.</td>
</tr>
<tr>
<td>Queue</td>
<td>Name of the queue to handle the process steps. Each One Identity Manager Service within the network must have a unique queue identifier. The process steps are requested by the job queue using exactly this queue name. The queue identifier is entered in the One Identity Manager Service configuration file.</td>
</tr>
<tr>
<td>Full server name</td>
<td>Full server name in accordance with DNS syntax. Example: &lt;Name of servers&gt;.&lt;Fully qualified domain name&gt;</td>
</tr>
</tbody>
</table>

**NOTE:** You can use the **Extended** option to make changes to other properties for the Job server. You can also edit the properties later with Designer.

4. Select **SharePoint** on the **Machine roles** page.

5. Select **SharePoint connector** on the **Server functions** page.

6. Check the One Identity Manager Service configuration on the **Service settings** page.

**NOTE:** The initial service configuration is predefined already. If further changes need to be made to the configuration, you can do this later with the Designer. For detailed information about configuring the service, see the *One Identity Manager Configuration Guide*.

7. To configure remote installations, click **Next**.

8. Confirm the security prompt with **Yes**.

9. Select the directory with the install files on **Select installation source**.

10. Select the file with the private key on the page **Select private key file**.

**NOTE:** This page is only displayed when the database is encrypted.

11. Enter the service's installation data on the **Service access** page.

**Table 4: Installation data**

<table>
<thead>
<tr>
<th>Data</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer</td>
<td>Server on which to install and start the service from.</td>
</tr>
</tbody>
</table>
### Data Description

<table>
<thead>
<tr>
<th>Data</th>
<th>Description</th>
</tr>
</thead>
</table>
| **To select a server** | - Enter a name for the server.  
  - OR -  
  - Select a entry from the list.                                                                                                           |
| **Service account** | User account data for the One Identity Manager Service.  
  **To enter a user account for the One Identity Manager Service**  
  - Enter user account, password and password confirmation.  
  The One Identity Manager Service farm's server farm account must be used as user account for SharePoint. |
| **Installation account** | Data for the administrative user account to install the service.  
  **To enter an administrative user account for installation**  
  - Enable Advanced.  
  - Enable Current user.  
  This uses the user account of the current user.  
  - OR -  
  - Enter user account, password and password confirmation. |

12. Click **Next** to start installing the service.  
   Installation of the service occurs automatically and may take some time.  
13. Click **Finish** on the last page of Server Installer.  

**NOTE:** The service is entered with the name **One Identity Manager Service** in the server service management.

## Creating a synchronization project for initial synchronization of a SharePoint farm

Use the Synchronization Editor to set up synchronization between the One Identity Manager database and SharePoint. The following describes the steps for initial configuration of a synchronization project.

A synchronization project collects all the information required for synchronizing the One Identity Manager database with a target system. Connection data for target systems, schema types and properties, mapping and synchronization workflows all belong to this.
After the initial configuration, you can customize and configure workflows within the synchronization project. Use the workflow wizard in the Synchronization Editor for this. The Synchronization Editor also provides different configuration options for a synchronization project.

Have the following information available for setting up a synchronization project.

**Table 5: Information required for setting up a synchronization project**

<table>
<thead>
<tr>
<th>Data</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>User account and password for SharePoint farm login</td>
<td>To access SharePoint objects, the connector logs in with the server farm account to the SharePoint farm. The server farm account's user name and password are required. For more information, see Users and permissions for synchronizing with a SharePoint farm on page 13.</td>
</tr>
</tbody>
</table>
| Domain synchronization server      | Server farm account domain. All One Identity Manager Service actions are executed against the target system environment on the synchronization server. Data entries required for synchronization and administration with the One Identity Manager database are processed by the synchronization server. Installed components:  
  - SharePoint server  
  - One Identity Manager Service (started)  
  - Synchronization Editor  
  - SharePoint connector  
  The synchronization server must be declared as a Job server in One Identity Manager. The Job server name is required. For more information, see Setting up the synchronization server on page 14. |
| Remote connection server           | To configure synchronization with a target system, One Identity Manager must load the data from the target system. One Identity Manager communicates directly with target system to do this. Sometimes direct access from the workstation on which the Synchronization Editor is installed is not possible, because of the firewall configuration, for example, or because the workstation does not fulfill the necessary hardware and software requirements. If you cannot start the Synchronization Editor on the synchronization server, you can set up a remote connection.  
  **To use a remote connection**  
  1. Provide a workstation on which the Synchronization Editor is installed. |
2. Install the RemoteConnectPlugin on the synchronization server. The synchronization server then simultaneously assumes the function of the remote connection server.

The remote connection server and the workstation must be in the same Active Directory domain.

Remote connection server configuration:

- One Identity Manager Service is started
- RemoteConnectPlugin is installed
- SharePoint connector is installed
- Target system specific components are installed

The remote connection server must be declared as a Job server in One Identity Manager. The Job server name is required.

For more detailed information about setting up a remote connection, see the *One Identity Manager Target System Synchronization Reference Guide*.

| One Identity Manager database connection data | Database server
| Database
| SQL Server Login and password
| Specifies whether integrated Windows authentication is used. This type of authentication is not recommended. If you decide to use it anyway, ensure that your environment supports Windows authentication.

There is an wizard to assist you with setting up a synchronization project. This wizard takes you all the steps you need to set up initial synchronization with a target system. Click **Next** once you have entered all the data for a step.

**NOTE:** The following sequence describes how you configure a synchronization project if Synchronization Editor is both:

- executed In default mode, and
- started from the launchpad

If you execute the project wizard in expert mode or directly from Synchronization Editor, additional configuration settings can be made. Follow the project wizard instructions through these steps.
To set up an initial synchronization project for a SharePoint farm

1. Start the Launchpad on the synchronization server and log on to the One Identity Manager database.
   
   **NOTE:** If synchronization is executed by an application server, connect the database through the application server.

2. Select **Target system type SharePoint** and click **Start**.
   This starts the Synchronization Editor's project wizard.

3. On the **System access** page, specify how One Identity Manager can access the target system.
   
   - If you started the launch pad on the synchronization server, do not change any settings.
   - If you started the launch pad on the gateway server, do not change any settings.
   
   Enable the option **Connect using remote connection server** and under **Job server** select the synchronization server with which the connection should be established.

4. Enter the connection data for the SharePoint farm in the system connection wizard. You can test the connection and save the connection data.
   
   - Enter the following connection data.

   **Table 6: SharePoint farm connection data**

<table>

<tr>
<td></td>
<td>This user account is used to synchronize SharePoint objects.</td>
</tr>
</tbody>
</table>

   - Click **Test now** to test the connection data.
     The Synchronization Editor attempts to connect to the SharePoint farm.

   - To save the connection data, enable **Save connection data on local computer**. This can be reused when you set up other synchronization projects.

5. On the **One Identity Manager Connection** tab, test the data for connecting to the One Identity Manager database. The data is loaded from the connected database. Reenter the password.
NOTE: If you use an unencrypted One Identity Manager database and have not yet saved any synchronization projects to the database, you need to enter all connection data again. This page is not shown if a synchronization project already exists.

6. The wizard loads the target system schema. This may take a few minutes depending on the type of target system access and the size of the target system.

7. On the Restrict target system access page, you specify how system access should work. You have the following options:

<table>
<thead>
<tr>
<th>Table 7: Specify target system access</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Option</strong></td>
</tr>
<tr>
<td>Read-only access to target system.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Read/write access to target system. Provisioning available.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

8. Select the synchronization server to execute synchronization on the Synchronization server page.

If the synchronization server is not declared as a Job server in the One Identity Manager database yet, you can add a new Job server.

a. Click to add a new Job server.

b. Enter a name for the Job server and the full server name conforming to DNS...
syntax.
c. Click **OK**.

The synchronization server is declared as Job server for the target system in the One Identity Manager- database.

| NOTE: After you save the synchronization project, ensure that this server is set up as a synchronization server. |

9. To close the project wizard, click **Finish**.

This creates and allocates a default schedule for regular synchronization. Enable the schedule for regular synchronization.

The synchronization project is created, saved and enabled immediately.

| NOTE: If you do not want the synchronization project to be activated immediately, disable the **Activate and save the new synchronization project automatically** option. In this case, save the synchronization project manually before closing the Synchronization Editor. |

| NOTE: The connection data for the target system is saved in a variable set and can be modified under **Configuration | Variables** in Synchronization Editor. |

**To configure the content of the synchronization log**

1. Open the synchronization project in the Synchronization Editor.
2. To configure the synchronization log for target system connection, select the category **Configuration | Target system**.
3. To configure the synchronization log for the database connection, select **Configuration | One Identity Manager connection**.
4. Select the **General** view and click **Configure**.
5. Select the **Synchronization log** view and set **Create synchronization log**.
6. Enable the data to be logged.

| NOTE: Some content generates a particularly large volume of log data. The synchronization log should only contain data required for troubleshooting and other analyses. |

7. Click **OK**.

**To synchronize on a regular basis**

1. Open the synchronization project in the Synchronization Editor.
2. Select the category **Configuration | Start up configurations**.
3. Select a start up configuration in the document view and click **Edit schedule**.
4. Edit the schedule properties.
5. To enable the schedule, click **Activate**.
6. Click **OK**.
To start initial synchronization manually

1. Open the synchronization project in the Synchronization Editor.
2. Select the category Configuration | Start up configurations.
3. Select a start up configuration in the document view and click Execute.
4. Confirm the security prompt with Yes.

NOTE:
Following a synchronization, employees are automatically assigned in the default installation. If an account definition for the site collection is not yet known at the time of synchronization, user accounts are linked with employees. However, account definitions are not assigned. The user accounts are therefore in a Linked state.

To manage the user accounts using account definitions, assign an account definition and a manage level to these user accounts.

To select user accounts through account definitions

1. Create an account definition.
2. Assign an account definition to the site collection.
3. Assign the account definition and manage level to user accounts in linked status.
   a. In Manager, select SharePoint | User accounts (user authenticated) | Linked but not configured | <Site collection>.
   b. In Manager, select SharePoint Online | User accounts (user authenticated) | Linked but not configured | <Site collection>.
   c. Select Assign account definition to linked accounts.

Detailed information about this topic

- For more information, see the One Identity Manager Target System Synchronization Reference Guide.

Related topics

- Automatically assigning employees to SharePoint user accounts on page 92
Special synchronization cases for valid permissions

Valid permissions are mapped in the One Identity Manager database in SPSWebAppHasPermission; assignments of valid permissions to permission levels are mapped in the table SPSRoleHasSPSPermission.

If you remove permissions from the list of valid permissions for a web application in SharePoint, the permissions cannot be assigned to permission levels within the web application from this point on. Assignments to permission levels that already exist for these permissions remain intact but are not active. These permissions are deleted from the table SPSWebAppHasPermission during synchronization. Assignments to permission levels that already exist for these permissions are not changed. Inactive permissions are displayed in the permission levels' overview.

Related topics
- SharePoint roles and permission levels on page 116

Displaying synchronization results

Synchronization results are summarized in the synchronization log. You can specify the extent of the synchronization log for each system connection individually. One Identity Manager provides several reports in which the synchronization results are organized under different criteria.

**To display a synchronization log**

1. Open the synchronization project in the Synchronization Editor.
2. Select Logs.
3. Click ▶ in the navigation view toolbar.
   Logs for all completed synchronization runs are displayed in the navigation view.
4. Select a log by double-clicking on it.
   An analysis of the synchronization is shown as a report. You can save the report.

**To display a provisioning log.**

1. Open the synchronization project in the Synchronization Editor.
2. Select Logs.
3. Click ⌘ in the navigation view toolbar.
   Logs for all completed provisioning processes are displayed in the navigation view.
4. Select a log by double-clicking on it.
   An analysis of the provisioning is show as a report. You can save the report.

The log is marked in color in the navigation view. This mark shows you the execution status of the synchronization/provisioning.

Synchronization logs are stored for a fixed length of time.

To modify the retention period for synchronization logs

- In Designer, enable the DPR | Journal | LifeTime configuration parameter and enter the maximum retention period.

Customizing synchronization configuration

You have used the Synchronization Editor to set up a synchronization project for initial synchronization of a SharePoint farm. You can use this synchronization project to load SharePoint objects into the One Identity Manager database. If you manage user accounts and their authorizations with One Identity Manager, changes are provisioned in the SharePoint environment.

You must customize the synchronization configuration to be able to regularly compare the database with the SharePoint environment and to synchronize changes.

- To use One Identity Manager as the master system during synchronization, create a workflow with synchronization in the direction of the Target system.
- You can use variables to create generally applicable synchronization configurations that contain the necessary information about the synchronization objects when synchronization starts. Variables can be implemented in base objects, schema classes, or processing methods, for example.
- Use variables to set up a synchronization project which can be used for several different farms. Store a connection parameter as a variable for logging in to the farms.
- To specify which SharePoint objects and database object are included in synchronization, edit the scope of the target system connection and the One Identity Manager database connection. To prevent data inconsistencies, define the same scope in both systems. If no scope is defined, all objects will be synchronized.
- Update the schema in the synchronization project if the One Identity Manager schema or target system schema has changed. Then you can add the changes to the mapping.
IMPORTANT: As long as synchronization is running, you must not start another synchronization for the same target system. This applies especially, if the same synchronization objects would be processed.

- If another synchronization is started with the same start up configuration, this process is stop and is assigned the Frozen execution status. An error message is written to the One Identity Manager Service log file.
- If another synchronization is started with another start up configuration, that addresses same target system, it may lead to synchronization error or loss of data. Specify One Identity Manager behavior in this case, in the start up configuration.
  - Use the schedule to ensure that the start up configurations are executed in sequence.
  - Group start up configurations with the same start up behavior. Specify Stop on error or Postpone and wait as start up behavior.

Detailed information about this topic

- How to configure SharePoint synchronization on page 26
- Configuring synchronization of several SharePoint farms on page 27
- Updating schemas on page 28
- One Identity Manager Target System Synchronization Reference Guide

How to configure SharePoint synchronization

The synchronization project for initial synchronization provides a workflow for initial loading of target system objects (initial synchronization) and one for provisioning object modifications from the One Identity Manager database to the target system (provisioning). To use One Identity Manager as the master system during synchronization, you also require a workflow with synchronization in the direction of the Target system.

To create a synchronization configuration for synchronizing SharePoint farms

1. Open the synchronization project in the Synchronization Editor.
   
   TIP: You can start the Synchronization Editor on any server to modify an existing synchronization project. Set up a remote connection to communicate with farm servers.

2. Check whether existing mappings can be used for synchronizing the target system. Create new maps if required.

3. Create a new workflow with the workflow wizard.
   Creates a workflow with Target system as its synchronization direction.
4. Create a new start up configuration. Use the new workflow to do this.
5. Save the changes.
6. Run a consistency check.

**Detailed information about this topic**
- Configuring synchronization of several SharePoint farms on page 27

**Configuring synchronization of several SharePoint farms**

**Prerequisites**
- The target system schema of both farms are identical.
- All virtual schema properties used in the mapping must exist in the extended schema of both farms.

**To customize a synchronization project for synchronizing another farm**
1. Install and configure a synchronization server for the other farm. Declare this server as Job server in the One Identity Manager.
2. Prepare a user account with sufficient permissions for synchronizing in the other farm.
3. Synchronize the Active Directory or LDAP environment, the other farm is going to run on.
4. Start the Synchronization Editor on the synchronization server of the other farm and log in on the One Identity Manager database.
5. Open the synchronization project.
6. Create a new base object for the other farm. Use the wizards to attach a base object.
   - In the wizard, select the SharePoint connector and declare the connection parameters. The connection parameters are saved in a special variable set.
     A start up configuration is created, which uses the newly created variable set.
7. Change other elements of the synchronization configuration as required.
8. Save the changes.
9. Run a consistency check.

**Detailed information about this topic**
- Setting up the synchronization server on page 14
- Users and permissions for synchronizing with a SharePoint farm on page 13
How to configure SharePoint synchronization on page 26

Updating schemas

All the schema data (schema types and schema properties) of the target system schema and the One Identity Manager schema are available when you are editing a synchronization project. Only a part of this data is really needed for configuring synchronization. If a synchronization project is finished, the schema is compressed to remove unnecessary data from the synchronization project. This can speed up loading the synchronization project. Deleted schema data can be added to the synchronization configuration again at a later point.

If the target system schema or the One Identity Manager schema has changed, these changes must also be added to the synchronization configuration. Then the changes can be added to the schema property mapping.

To include schema data that have been deleted through compressing and schema modifications in the synchronization project, update each schema in the synchronization project. This may be necessary if:

- A schema was changed by:
  - Changes to a target system schema
  - Customizations to the One Identity Manager schema
  - A One Identity Manager update migration
- A schema in the synchronization project was shrunk by:
  - enabling the synchronization project
  - saving the synchronization project for the first time
  - compressing a schema

To update a system connection schema

1. Open the synchronization project in the Synchronization Editor.
2. Select Configuration | Target system.
   - OR -
   Select Configuration | One Identity Manager Connection.
3. Select the view General and click Update schema.
4. Confirm the security prompt with Yes.
   This reloads the schema data.

To edit a mapping

1. Open the synchronization project in the Synchronization Editor.
2. Select the category Mappings.
3. Select a mapping in the navigation view.
Opens the Mapping Editor. For more detailed information about mappings, see the One Identity Manager Target System Synchronization Reference Guide.

**NOTE:** The synchronization is deactivated if the schema of an activated synchronization project is updated. Reactivate the synchronization project to synchronize.

### Speeding up synchronization with revision filtering

Synchronization with SharePoint does not support revision filtering.

### Post-processing outstanding objects

Objects, which do not exist in the target system, can be marked as outstanding in One Identity Manager by synchronizing. This prevents objects being deleted because of an incorrect data situation or an incorrect synchronization configuration.

**Outstanding objects**

- Cannot be edited in One Identity Manager.
- Are ignored by subsequent synchronization.
- Are ignored by inheritance calculations.

This means, all memberships and assignments remain intact until the outstanding objects have been processed.

Start target system synchronization to do this.

**To post-process outstanding objects**

1. In Manager, select the **SharePoint | Target system synchronization:** **SharePoint** category.
   
   All tables assigned to the target system type **SharePoint** as synchronization tables are displayed in the navigation view.

2. On the **Target system synchronization** form, in the **Table / object** column, open the node of the table for which you want to post-process outstanding objects.

   All objects that are marked as outstanding are shown. The **Last log entry** and **Last method run** columns display the time at which the last entry was made in the synchronization log and which processing method was executed. The **No log available** entry can mean the following:

   - The synchronization log has already been deleted.
   - OR -
An assignment from a member list has been deleted in the target system. The base object of the assignment has been updated during the synchronization. A corresponding entry appears in the synchronization log. The entry in the assignment table is marked as outstanding, but there is no entry in the synchronization log.

An object that contains a member list has been deleted in the target system. During synchronization, the object and all corresponding entries in assignment tables are marked as outstanding. However, an entry in the synchronization log appears only for the deleted object.

**TIP:**

*To display object properties of an outstanding object*

a. Select the object on the target system synchronization form.
b. Open the context menu and click **Show object**.

3. Select the objects you want to rework. Multi-select is possible.
4. Click one of the following icons in the form toolbar to execute the respective method.

**Table 8: Methods for handling outstanding objects**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="delete" alt="Delete" /></td>
<td>Delete</td>
<td>The object is immediately deleted in the One Identity Manager database. Deferred deletion is not taken into account. The <strong>Outstanding</strong> label is removed for the object. Indirect memberships cannot be deleted.</td>
</tr>
</tbody>
</table>
| ![Publish](publish) | Publish | The object is added in the target system. The **Outstanding** label is removed for the object. The method triggers the **HandleOutstanding** event. This runs a target system specific process that triggers the provisioning process for the object. Prerequisites:  
  - The table containing the object can be published.  
  - The target system connector has write access to the target system. |
| ![Reset](reset) | Reset | The **Outstanding** label is removed for the object. |

5. Confirm the security prompt with **Yes**.
NOTE: By default, the selected objects are processed in parallel, which speeds up execution of the selected method. If an error occurs during processing, the action is stopped and all changes are discarded.

Bulk processing of objects must be disabled if errors are to be localized, which means the objects are processed sequentially. Failed objects are named in the error message. All changes that were made up until the error occurred are saved.

To disable bulk processing
- Deactivate in the form toolbar.

You must customize synchronization to synchronize custom tables.

To add custom tables to the target system synchronization
1. In Manager, select SharePoint | Basic configuration data | Target system types.
2. In the result list, select the target system type SharePoint.
3. Select Assign synchronization tables.
4. Assign custom tables whose outstanding objects you want to handle in Add assignments.
5. Save the changes.
6. Select Configure tables for publishing.
7. Select custom tables whose outstanding objects can be published in the target system and set Publishable.
8. Save the changes.

NOTE: The target system connector must have write access to the target system in order to publish outstanding objects that are being post-processed. That means, the option Connection is read only must no be set for the target system connection.

Configuring provisioning memberships

Memberships, for example, user accounts in groups, are saved in assignment tables in the One Identity Manager database. During provisioning of modified memberships, changes made in the target system will probably be overwritten. This behavior can occur under the following conditions:

- Memberships are saved in the target system as an object property in list form (Example: List of user accounts in the Users property of an SPGroup).
- Memberships can be modified in either of the connected systems.
- A provisioning workflow and provisioning processes are set up.
If a membership in One Identity Manager changes, the complete list of members is transferred to the target system by default. Memberships, previously added to the target system are removed by this; previously deleted memberships are added again.

To prevent this, provisioning can be configured such that only the modified membership is provisioned in the target system. The corresponding behavior is configured separately for each assignment table.

**To allow separate provisioning of memberships**

1. In Manager, select **SharePoint | Basic configuration data | Target system types**.
2. Select **SharePoint** in the result list.
3. Select **Configure tables for publishing**.
4. Select the assignment tables for which you want to allow separate provisioning. Multi-select is possible.
   - This option can only be enabled for assignment tables that have a base table with XDateSubItem or CCC_XDateSubItem column.
   - Assignment tables that are grouped together in a virtual schema property in the mapping must be marked identically (for example, SPSGroupHasSPSRLAsgn and SPSUserHasSPSRLAsgn).
5. Click **Enable merging**.
6. Save the changes.

For each assignment table labeled like this, the changes made in One Identity Manager are saved in a separate table. During modification provisioning, the members list in the target system is compared to the entries in this table. This means that only modified memberships are provisioned and the members list does not get entirely overwritten.

**NOTE:** The complete members list is updated by synchronization. During this process, objects with changes but incomplete provisioning are not handled. These objects are logged in the synchronization log.

For more detailed information about provisioning memberships, see the One Identity Manager Target System Synchronization Reference Guide.

### Help for the analysis of synchronization issues

You can generate a report for analyzing problems which occur during synchronization, for example, insufficient performance. The report contains information such as:

- Consistency check results
- Revision filter settings
- Scope applied
- Analysis of the synchronization buffer
- Object access times in the One Identity Manager database and in the target system

To generate a synchronization analysis report

1. Open the synchronization project in the Synchronization Editor.
2. Select the menu Help | Generate synchronization analysis report and answer the security prompt with Yes.
   The report may take a few minutes to generate. It is displayed in a separate window.
3. Print the report or save it in one of the available output formats.

Deactivating synchronization

Regular synchronization cannot be started until the synchronization project and the schedule are active.

To prevent regular synchronization

1. Open the synchronization project in the Synchronization Editor.
2. Select the start up configuration and deactivate the configured schedule.
   Now you can only start synchronization manually.

An activated synchronization project can only be edited to a limited extend. The schema in the synchronization project must be updated if schema modifications are required. The synchronization project is deactivated in this case and can be edited again.

Furthermore, the synchronization project must be deactivated if synchronization should not be started by any means (not even manually).

To deactivate the synchronization project

1. Open the synchronization project in the Synchronization Editor.
2. Select General on the start page.
3. Click Deactivate project.

Detailed information about this topic

- Creating a synchronization project for initial synchronization of a SharePoint farm on page 17
Basic data for managing a SharePoint environment

The following data is relevant for managing a SharePoint environment in One Identity Manager.

- **Configuration parameters**
  Use configuration parameters to configure the behavior of the system's basic settings. One Identity Manager provides default settings for different configuration parameters. Check the configuration parameters and modify them as necessary to suit your requirements.

  Configuration parameters are defined in the One Identity Manager modules. Each One Identity Manager module can also install configuration parameters. You can find an overview of all configuration parameters in **Base data | General | Configuration parameters** in Designer.

  For more information, see Appendix: Configuration parameters for managing SharePoint environments on page 136.

- **Account definitions**
  One Identity Manager has account definitions for automatically allocating user accounts to employees during working hours. You can create account definitions for every target system. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee.

  For more information, see Setting up account definitions on page 46.

- **Authentication modes**
  One Identity Manager supports claims-based authentication as well as classical Windows authentication for logging on to the SharePoint server. The authentication mode to use is defined for the web application and for the user accounts. Usable authentication modes are maintained in the One Identity Manager database.

  For more information, see Authentication modes on page 35.
Prefixes
Prefixes are URLs relative to a web application that can be stored under a site collection.
For more information, see Prefixes on page 36.

Zones and alternative URLs
All the zones that you can configure for a web application are stored in the One Identity Manager database.
For more information, see Zones and alternative URLs on page 37.

Site templates
Use site templates to add sites.
For more information, see SharePoint site templates on page 37.

Permissions
User permissions for a SharePoint site or a web application are authorized by SharePoint permissions. Permissions are grouped into permission levels and permission policies.
For more information, see SharePoint permissions on page 38.

Target system types
Target system types are required for configuring target system comparisons. Tables containing outstanding objects are maintained on target system types.
For more information, see Post-processing outstanding objects on page 29.

Server
In order to handle SharePoint-specific processes in One Identity Manager, the synchronization server and its server functions must be declared.
For more information, see Editing a server on page 39.

Target system managers
A default application role exists for the target system manager in One Identity Manager. Assign the employees who are authorized to edit all SharePoint farms in One Identity Manager to this application role.
Define additional application roles if you want to limit the edit permissions for target system managers to individual farms. SharePoint The application roles must be added under the default application role.
For more information, see Target system managers on page 44.

Authentication modes
One Identity Manager supports claims-based authentication as well as classical Windows authentication for logging on to the SharePoint server. The authentication mode to use is defined for the web application and for the user accounts. Usable authentication modes are
maintained in the One Identity Manager database. The One Identity Manager supplies the default authentication systems "Windows (Claims)" (=claims-based Windows authentication) and "Windows Classic Mode" (=classic Window authentication). If you use other authentication systems in your SharePoint environment, add them separately in the One Identity Manager. This makes it possible to assign user accounts to authentication modes. Enter the user and group prefix data. This is required to add new SharePoint user accounts in the One Identity Manager.

To add an authentication mode

1. Select | Basic configuration data | Authentication modesSharePoint.
2. Click in the result list.
3. Enter the required data on the master data form.
4. Save the changes.

Enter the required data for your own authentication mode:

Table 9: Authentication mode properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System ID</td>
<td>A identifier for the authentication mode.</td>
</tr>
<tr>
<td>User prefix</td>
<td>Prefix for formatting a login name for new user accounts. The associated authentication object is not a group. This means, the user account option Group is not set.</td>
</tr>
<tr>
<td>Group prefix</td>
<td>Prefix for formatting a login name for new user accounts. The associated authentication object is a group. This means, the user account option Group is set.</td>
</tr>
<tr>
<td>Column for login name</td>
<td>Column in the table Person used to format the login name for new user accounts. This information is required if employees are linked to user accounts though automatic employee assignment.</td>
</tr>
</tbody>
</table>

To assign your own authentication modes automatically to user accounts

- In Designer, modify the template for the SPSUser.UID_SPAuthSystem column. For more information, see the One Identity Manager Configuration Guide.

Prefixes

Prefixes are URLs relative to a web application that can be stored under a site collection. Prefix properties such as relative path, absolute path and prefix type, are displayed on the overview form with the associated web application.
To obtain an overview of a prefix

1. Select SharePoint | Basic configuration data | Prefixes.
2. Select a profile in the result list.
3. Select SharePoint prefix overview in the task view.

Zones and alternative URLs

All the zones that you can configure for a web application are stored in the One Identity Manager database. You can see the alternative URLs that are configured for accessing the web application on the zone’s overview form.

To obtain an overview of a zone

1. Select SharePoint | Basic configuration data | Zones.
2. Select the zone in the result list.
3. Select SharePoint zone overview in the task view.

To obtain an overview of alternative URL of a web application

1. Select SharePoint | Hierarchical view | <farm> | Web applications | <web application> | URLs.
2. Select the URL in the result list.
3. Select SharePoint alternative URL overview in the task view.

SharePoint site templates

Use site templates to add sites. If new sites are meant to be added with One Identity Manager, load the site template into the One Identity Manager database using synchronization. The languages in which site templates are available are displayed on the overview form.

To obtain an overview of a site template

1. Select SharePoint | Basic configuration data | Site templates.
2. Select the site template in the result list.
3. Select Site template overview.
SharePoint permissions

User permissions for a SharePoint site or a web application are authorized by SharePoint permissions. Permissions are grouped into permission levels and permission policies. All web application permission policies, explicitly granted or rejected for the permission, are displayed on the permissions overview form.

In SharePoint, you can limit the number of permissions that can be assigned to permission levels. You are shown an overview of web applications permitted for the permissions.

To obtain an overview of permissions

1. Select SharePoint | Basic configuration data | Permissions.
2. Select the permissions in the result list.
3. Select SharePoint permissions overview in the task view.

You can assign permissions to permission levels in One Identity Manager.

To assign valid permissions to permission levels

1. Select SharePoint | Basic configuration data | Permissions.
2. Select the permissions in the result list.
3. Select Assign permission levels.
4. Assign the permission levels in Add assignments.
   - OR -
   Remove the permission levels in Remove assignments.
5. Save the changes.

Related topics

- SharePoint roles and permission levels on page 116

SharePoint quotas

You can view the SharePoint farm and site collections that the quota is assigned to on the quota overview form.

To obtain an overview of a quota

1. Select SharePoint | Quotas.
2. Select the quota in the result list.
3. Select SharePoint quota overview.
SharePoint languages

All the languages that have language packets installed in the One Identity Manager environment are mapped in the SharePoint database.

To obtain an overview of a language

1. Select SharePoint | Hierarchical view | <farm> | Languages.
2. Select the language in the result list.
3. Select SharePoint language overview.

Editing a server

In order to handle SharePoint-specific processes in One Identity Manager, the synchronization server and its server functions must be declared. You have several options for defining a server's functionality:

- Create an entry for the Job server in Designer under Base Data | Installation | Job server. For detailed information, see One Identity Manager Configuration Guide.
- Select an entry for the Job server in SharePoint | Basic configuration data | Server in Manager and edit the Job server master data.
  Use this task if the Job server has already been declared in One Identity Manager and you want to configure special functions for the Job server.

NOTE: One Identity Manager must be installed, configured, and started in order for a server to execute its function in the One Identity Manager Service network. Proceed as described in the One Identity Manager Installation Guide.

To edit a Job server and its functions

1. In Manager, select the category SharePoint | Basic configuration data | Server.
2. Select the Job server entry in the result list.
3. Select Change master data.
4. Edit the Job server’s master data.
5. Select Assign server functions in the task view and specify server functionality.
6. Save the changes.
Detailed information about this topic

- Master data for a Job server on page 40
- Specifying server functions on page 42

Related topics

- Setting up the synchronization server on page 14

Master data for a Job server

0 NOTE: All editing options are also available in Designer under Base Data | Installation | Job server.

0 NOTE: More properties may be available depending on which modules are installed.

Target system managers

A default application role exists for the target system manager in One Identity Manager. Assign the employees who are authorized to edit all SharePoint farms in One Identity Manager to this application role.

Define additional application roles if you want to limit the edit permissions for target system managers to individual farms. The application roles must be added under the default application role.

For detailed information about implementing and editing application roles, see the One Identity Manager Authorization and Authentication Guide.

Implementing application roles for target system managers

1. The One Identity Manager administrator assigns employees to be target system managers.
2. These target system managers add employees to the default application role for target system managers.
   Target system managers with the default application role are authorized to edit all SharePoint farms in One Identity Manager.
3. Target system managers can authorize other employees within their area of responsibility as target system managers and if necessary, create additional child application roles and assign these to individual SharePoint farms.

</tbody>
</table>
To initially specify employees to be target system administrators

1. Log in to One Identity Manager as Manager administrator (Base role | Administrators).
2. Select One Identity Manager Administration | Target systems | Administrators.
3. Select Assign employees.
4. Assign the employee you want and save the changes.

To add the first employees to the default application as target system managers.

1. Log yourself into Manager as target system administrator (Target systems | Administrators).
2. Select One Identity Manager Administration | Target systems | SharePoint.
3. Select Assign employees in the task view.
4. Assign the employees you want and save the changes.

To authorize other employees as target system managers when you are a target system manager

1. Login to Manager as target system manager.
2. Select the application role in SharePoint | Basic configuration data | Target system managers.
3. Select Assign employees.
4. Assign the employees you want and save the changes.

To specify target system managers for individual SharePoint farms

1. Log in to Manager as target system manager.
2. Select SharePoint | Farms.
3. Select the farm in the result list.
4. Select Change master data.
5. On the General tab, select the application role in the Target system manager menu.
   - OR -
   Next to the Target system manager menu, click to create a new application role.
a. Enter the application role name and assign the **Target systems | SharePoint** parent application role.

b. Click **OK** to add the new application role.

6. Save the changes.

7. Assign employees to this application role who are permitted to edit the farm in One Identity Manager.

**Setting up account definitions**

One Identity Manager has account definitions for automatically allocating user accounts to employees during working hours. You can create account definitions for every target system. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee.

The data for the user accounts in the respective target system comes from the basic employee data. The employee must own a user account. The assignment of the IT operating data to the employee's user account is controlled through the primary assignment of the employee to a location, a department, a cost center, or a business role (template processing). Processing is done through templates. There are predefined templates for determining the data required for user accounts included in the default installation. You can customize templates as required.

For detailed information about account definitions, see the **One Identity Manager Target System Base Module Administration Guide**.

**NOTE:** Only SharePoint user accounts that are not marked as a group can be created with account definitions (IsDomainGroup = 'false'). However, it is recommended to create SharePoint user accounts based on target system groups. Only use account definitions for SharePoint if you are not following standard procedure. For more information, see SharePoint user accounts on page 76.

The following steps are required to implement an account definition:

- Creating an account definition
- Creating manage levels
- Creating a formatting rule for IT operating data
- Determining IT operating data
- Assigning account definitions to employees
- Assigning account definitions to a target system
Creating an account definition

To create a new account definition

1. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.
2. Select an account definition in the result list. Select Change master data.

-OR-

Click ▪ in the result list.
3. Enter the account definition's master data.
4. Save the changes.

Master data for an account definition

Enter the following data for an account definition:

Table 13: Master data for an account definition

</table>
| Risk index                     | Value for evaluating the risk of account definition assignments to employees. Enter a value between 0 and 1. This input field is only visible if the configuration parameter **QER | CalculateRiskIndex** is activated.  
  *For more detailed information, see the One Identity Manager Risk Assessment Administration Guide.*                                                                                                               |
| Service item                   | Service item through which you can request the account definition in the IT Shop. Assign an existing service item or add a new one.                                                                                                                                                                                                          |
| IT Shop                        | Specifies whether the account definition can be requested through the IT Shop. The account definition can be ordered by an employee over the Web Portal and distributed using a defined approval process. The account definition can also be assigned directly to employees and roles outside of IT Shop.                                                     |
| Only for use in IT Shop         | Specifies whether the account definition can only be requested through the IT Shop. The account definition can be ordered by an employee over the Web Portal and distributed using a defined approval process. This means, the account definition cannot be directly assigned to roles outside the IT Shop.                                                           |
| Automatic assignment to employees | Specifies whether the account definition is assigned automatically to all internal employees. The account definition is assigned to every employee not marked as external, on saving. New employees automatically obtain this account definition as soon as they are added.   
  **IMPORTANT:** Only set this option if you can ensure that all current internal employees in the database and all pending newly added internal employees obtain a user account in this target system.   
  Disable this option to remove automatic assignment of the account definition to all employees. The account definition cannot be reassigned to employees from this point on. Existing account definition assignments remain intact. |
| Retain account definition if permanently disabled | Specifies the account definition assignment to permanently disabled employees.  
  Option set: the account definition assignment remains in effect. The user account stays the same.  
  Option not set: the account definition assignment is not in effect. The associated user account is deleted.                                                                                                      |

</tr>
</tbody>
</table>

**Creating manage levels**

Specify the manage level for an account definition for managing user accounts. The user account’s manage level specifies the extent of the employee’s properties that are inherited by the user account. This allows an employee to have several user accounts in one target system, for example:

- Default user account that inherits all properties from the employee
- Administrative user account that is associated to an employee but should not inherit the properties from the employee.

One Identity Manager supplies a default configuration for manage levels:

- **Unmanaged**: User accounts with the Unmanaged manage level are linked to the employee but they do not inherit any further properties. When a new user account is added with this manage level and an employee is assigned, some of the employee's
properties are transferred initially. If the employee properties are changed at a later date, the changes are not passed onto the user account.

- **Full managed**: User accounts with the Full managed manage level inherit defined properties of the assigned assigned employee. When a new user account is created with this manage level and an employee is assigned, the employee’s properties are transferred in an initial state. If the employee properties are changed at a later date, the changes are passed onto the user account.

**NOTE:** The Full managed and Unmanaged are analyzed in templates. You can customize the supplied templates in the Designer.

You can define other manage levels depending on your requirements. You need to amend the templates to include manage level approaches.

Specify the effect of temporarily or permanently disabling, deleting or the security risk of an employee on its user accounts and group memberships for each manage level. For detailed information about manage levels, see the One Identity Manager Target System Base Module Administration Guide.

- Employee user accounts can be locked when they are disabled, deleted or rated as a security risk so that permissions are immediately withdrawn. If the employee is reinstated at a later date, the user accounts are also reactivated.
- You can also define group membership inheritance. Inheritance can be discontinued if desired when, for example, the employee’s user accounts are disabled and therefore cannot be members in groups. During this time, no inheritance processes should be calculated for this employee. Existing group memberships are deleted!

**To assign manage levels to an account definition**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Assign manage level**.
4. Assign the manage levels in **Add assignments**.
   - OR -
   Delete the manage levels in **Remove assignments**.
5. Save the changes.

**IMPORTANT:** The Unmanaged manage level is assigned automatically when you create an account definition and it cannot be removed.

**To edit a manage level**

1. Select **SharePoint | Basic configuration data | Account definitions | Manage levels**.
2. Select the manage level in the result list. Select **Change master data**.
   - OR -

One Identity Manager 8.1.1 Administration Guide for Connecting to SharePoint

Basic data for managing a SharePoint environment
Creating a formatting rule for IT operating data

An account definition specifies which rules are used to form the IT operating data and which default values will be used if no IT operating data can be found through the employee's primary roles.

The following IT operating data is used in the One Identity Manager default configuration for automatic creating and modifying of user accounts for an employee in the target system.

- SharePoint authentication mode
- SharePoint Online authentication mode
- Groups can be inherited
- Identity
- Privileged user account

To create a mapping rule for IT operating data

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.

2. Select an account definition in the result list.
3. Select **Edit IT operating data mapping** and enter the following data.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>User account property for which the value is set. In the menu, you can select the columns that use the TSB_ITDataFromOrg script in their template. For detailed information, see the <em>One Identity Manager Target System Base Module Administration Guide</em>.</td>
</tr>
</tbody>
</table>
| Source   | Specifies which roles to use in order to find the user account properties. You have the following options:  
- Primary department  
- Primary location  
- Primary cost center  
- Primary business roles  

![NOTE: Only use the primary business role if the Business Roles Module is installed.](image)
- Empty  
  - If you select a role, you must specify a default value and set the option **Always use default value**. |

<table>
<thead>
<tr>
<th>Default value</th>
<th>Default value of the property for an employee's user account if the value is not determined dynamically from the IT operating data.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always use default value</td>
<td>Specifies whether user account properties are always filled with the default value. IT operating data is not determined dynamically from a role.</td>
</tr>
<tr>
<td>Notify when applying the standard</td>
<td>Specifies whether email notification to a defined mailbox is sent when the default value is used. The <em>Employee - new user account with default properties created</em> mail template is used. To change the mail template, adjust the *TargetSystem</td>
</tr>
</tbody>
</table>

4. Save the changes.

## Determining IT operating data

To create user accounts with the **Full managed** manage level, the required IT operating data must be determined. The operating data required to automatically supply an employee with IT resources is shown in the business roles, departments, locations or cost centers. An employee is assigned a primary business role, primary location, primary department or primary cost center. The necessary IT operating data is ascertained from
these assignments and used in creating the user accounts. Default values are used if valid IT operating data cannot be found over the primary roles.

You can also specify IT operating data directly for a specific account definition.

**Example**

Normally, each employee in department A obtains a default user account in the A. In addition, certain employees in department A obtain administrative user accounts in the A.

Create an account definition A for the default user account of the A and an account definition B for the administrative user account of A. Specify the property "Department" in the IT operating data formatting rule for the account definitions A and B in order to determine the valid IT operating data.

Specify the effective IT operating data of department A for the A. This IT operating data is used for standard user accounts. In addition, specify the effective account definition B IT operating data for department A. This IT operating data is used for administrative user accounts.

**To define IT operating data**

1. In Manager, select the role in the Organizations or Business roles category.
2. Select the Edit IT operating data task.
3. Click **Add** and enter the following data.

**Table 16: IT operating data**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effects on</td>
<td>IT operating data application scope. The IT operating data can be used for a target system or a defined account definition.</td>
</tr>
<tr>
<td></td>
<td>To specify an application scope</td>
</tr>
<tr>
<td></td>
<td>a. Click ➔ next to the text box.</td>
</tr>
<tr>
<td></td>
<td>b. Under <strong>Table</strong>, select the table that maps the target system for select the TSBAccountDef table for an account definition.</td>
</tr>
<tr>
<td></td>
<td>c. Select the specific target system or account definition under <strong>Effects on</strong>.</td>
</tr>
<tr>
<td></td>
<td>d. Click <strong>OK</strong>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Column</th>
<th>User account property for which the value is set.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>In the menu, you can select the columns that use the TSB_ITDataFromOrg script in their template. For detailed information, see the One Identity Manager Target System Base Module Administration Guide.</td>
</tr>
</tbody>
</table>

| Value             | Concrete value which is assigned to the user account property.                                                                             |

4. Save the changes.

**Modify IT operating data**

If IT operating data changes, you must transfer these changes to the existing user accounts. To do this, templates must be rerun on the affected columns. Before you can run the templates, you can check what effect a change to the IT operating data has on the existing user accounts. You can decide whether the change is transferred to the One Identity Manager database in the case of each affected column in each affected database.

**Prerequisites**

- The IT operating data of a department, cost center, business role, or a location was changed.
  - OR -
- The default values in the IT operating data template were modified for an account definition.

**NOTE:** If the assignment of an employee to a primary department, cost center, business role or to a primary location changes, the templates are automatically executed.
To execute the template

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Execute templates** in the task view
   This displays a list of all user account, which are created through the selected account definition and whose properties are changed by modifying the IT operating data.

   - **Old value:** Current value of the object property.
   - **New value:** Value that the object property would have following modification of the IT operating data.
   - **Selection:** Specifies whether the modification shall be adopted for the user account.

4. Mark all the object properties in the **selection** column that will be given the new value.
5. Click **Apply**.
   The templates are applied to all selected user accounts and properties.

Assigning account definitions to employees

Account definitions are assigned to company employees.

Indirect assignment is the default method for assigning account definitions to employees. Account definitions are assigned to departments, cost centers, locations or roles. The employees are categorized into these departments, cost centers, locations or roles depending on their function in the company and thus obtain their account definitions. To react quickly to special requests, you can assign individual account definitions directly to employees.

You can automatically assign special account definitions to all company employees. It is possible to assign account definitions to the IT Shop as requestable products. A department manager can then request user accounts from the Web Portal for his staff. It is also possible to add account definitions to system roles. These system roles can be assigned to employees through hierarchical roles or directly or added as products in the IT Shop.

In the One Identity Manager default installation, the processes are checked at the start to see if the employee already has a user account in the target system that has an account definition. If no user account exists, a new user account is created with the account definition's default manage level.

**NOTE:** If a user account already exists and is disabled, then it is re-enabled. You have to alter the user account manage level afterwards in this case.
Prerequisites for indirect assignment of account definitions to employees

- Assignment of employees and account definitions is permitted for role classes (department, cost center, location or business role).

**NOTE:** As long as an account definition for an employee is valid, the employee retains the user account that was created by it. If the assignment of an account definition is removed, the user account that was created from this account definition is deleted.

For detailed information about preparing role classes to be assigned, see the One Identity Manager Identity Management Base Module Administration Guide.

Assigning account definitions to departments, cost centers, and locations

**To add account definitions to hierarchical roles**

1. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.
2. Select an account definition in the result list.
3. Select Assign organizations.
4. Assign organizations in Add assignments.
   - Assign departments on the Departments tab.
   - Assign locations on the Locations tab.
   - Assign cost centers on the Cost centers tab.

**TIP:** In the Remove assignments area, you can remove the assignment of organizations.

**To remove an assignment**

- Select the organization and double click ✅.

5. Save the changes.

Assigning account definitions to business roles

Installed modules: Business Roles Module

**To add account definitions to hierarchical roles**

1. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.
2. Select an account definition in the result list.
3. Select **Assign business roles** in the task view.

4. Assign business roles in **Add assignments**.

   **TIP:** In the **Remove assignments** area, you can remove the assignment of business roles.

   **To remove an assignment**
   - Select the business role and double click ✑.

5. Save the changes.

---

**Assigning account definitions to all employees**

**To assign an account definition to all employees**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.

2. Select an account definition in the result list.

3. Select **Change master data**.

4. Set **Automatic assignment to employees** on General.

   **IMPORTANT:** Only set this option if you can ensure that all current internal employees in the database and all pending newly added internal employees obtain a user account in this target system.

5. Save the changes.

The account definition is assigned to every employee that is not marked as external. New employees automatically obtain this account definition as soon as they are added. The assignment is calculated by the DBQueue Processor.

**NOTE:** Disable **Automatic assignment to employees** to remove automatic assignment of the account definition to all employees. The account definition cannot be reassigned to employees from this point on. Existing assignments remain intact.

---

**Assigning account definitions directly to employees**

**To assign an account definition directly to employees**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.

2. Select an account definition in the result list.

3. Select **Assign to employees** in the task view.
4. Assign employees in **Add assignments**.
   
   **TIP:** In the **Remove assignments** area, you can remove the assignment of employees.
   
   **To remove an assignment**
   
   - Select the employee and double-click ☑.

5. Save the changes.

### Assigning account definitions to system roles

Installed modules:  System Roles Module

**NOTE:** Account definitions with **Only use in IT Shop** can only be assigned to system roles that also have this option set.

**To add account definitions to a system role**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.
2. Select an account definition in the result list.
3. Select **Assign system roles in the task view**.
4. Assign system roles in **Add assignments**.
   
   **TIP:** In the **Remove assignments** area, you can remove the assignment of system roles.
   
   **To remove an assignment**
   
   - Select the system role and double click ☑.

5. Save the changes.

### Adding account definitions to the IT Shop

A account definition can be requested by shop customers when it is assigned to an IT Shop shelf. To ensure it can be requested, further prerequisites need to be guaranteed.

- The account definition must be labeled with the **IT Shop** option.
- The account definition must be assigned to a service item.

**TIP:** In Web Portal, all products that can be requested are grouped together by service category. To make the account definition easier to find in Web Portal, assign a service category to the service item.

- If the account definition is only assigned to employees using IT Shop assignments,
you must also set **Only for use in IT Shop**. Direct assignment to hierarchical roles may not be possible.

**NOTE:** IT Shop administrators can assign account definitions to IT Shop shelves if login is role-based. Target system administrators are not authorized to add account definitions in the IT Shop.

**To add an account definition to the IT Shop**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions** (non-role-based login).
   - OR -
   In Manager, select **Entitlements | Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Add to IT Shop**.
4. Assign the account definitions to the IT Shop shelves in **Add assignments**.
5. Save the changes.

**To remove an account definition from individual IT Shop shelves**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions** (non-role-based login).
   - OR -
   In Manager, select **Entitlements | Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Add to IT Shop**.
4. Remove the account definitions from the IT Shop shelves in **Remove assignments**.
5. Save the changes.

**To remove an account definition from all IT Shop shelves**

1. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions** (non-role-based login).
   - OR -
   In Manager, select **Entitlements | Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.
   The account definition is removed from all shelves by One Identity Manager Service. All requests and assignment requests with this account definition are canceled in the process.
For more detailed information about request from company resources through the IT Shop, see the *One Identity Manager IT Shop Administration Guide*.

**Assigning account definitions to a target system**

The following prerequisites must be fulfilled if you implement automatic assignment of user accounts and employees resulting in administered user accounts (state **Linked configured**):

- The account definition is assigned to the target system.
- The account definition has the default manage level.

User accounts are only linked to the employee (**Linked**) if no account definition is given. This is the case on initial synchronization, for example.

**To assign the account definition to a target system**

1. In Manager, select the site collection in SharePoint | Site collections.
2. Select Change master data.
3. Select the account definition for user accounts from Account definition (initial).
4. Save the changes.

**Deleting an account definition**

You can delete account definitions if they are not assigned to target systems, employees, hierarchical roles or any other account definitions.

**To delete an account definition**

1. Remove automatic assignments of the account definition from all employees.
   a. In Manager, select **SharePoint | Basic configuration data | Account definitions | Account definitions**.
b. Select an account definition in the result list.

c. Select Change master data.

d. Disable Automatic assignment to employees on the General tab.

e. Save the changes.

2. Remove direct assignments of the account definition to employees.

   a. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.

   b. Select an account definition in the result list.

   c. Select Assign to employees in the task view.

   d. Remove employees from Remove assignments.

   e. Save the changes.

3. Remove the account definition's assignments to departments, cost centers and locations.

   a. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.

   b. Select an account definition in the result list.

   c. Select Assign organizations.

   d. In Remove assignments, remove the relevant departments, cost centers, and locations.

   e. Save the changes.

4. Remove the account definition's assignments to business roles.

   a. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.

   b. Select an account definition in the result list.

   c. Select Assign business roles.

   d. Remove the business roles in Remove assignments.

   e. Save the changes.

5. If the account definition was requested through the IT Shop, it must be canceled and removed from all IT Shop shelves.

   For more detailed information about unsubscribing requests, see the One Identity Manager Web Portal User Guide.

   To remove an account definition from all IT Shop shelves

   a. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions (non-role-based login).

      - OR -

   In Manager, select Entitlements | Account definitions (role-based login).
b. Select an account definition in the result list.

c. Select Remove from all shelves (IT Shop).

d. Confirm the security prompt with Yes.

e. Click OK.

The account definition is removed from all shelves by One Identity Manager Service. All requests and assignment requests with this account definition are canceled in the process.

6. Remove the account definition assignment as required account definition for another account definition. As long as the account definition is required for another account definition, it cannot be deleted. Check all the account definitions.

   a. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.
   
   b. Select an account definition in the result list.
   
   c. Select Change master data.
   
   d. Remove the account definition in the Required account definition menu.
   
   e. Save the changes.

7. Remove the account definition's assignments to target systems.

   a. In Manager, select the site collection in SharePoint | Site collections.
   
   b. Select Change master data.
   
   c. Remove the assigned account definitions on the General tab.
   
   d. Save the changes.

8. Delete the account definition.

   a. In Manager, select SharePoint | Basic configuration data | Account definitions | Account definitions.
   
   b. Select an account definition in the result list.
   
   c. Click to delete an account definition.
SharePoint farms

NOTE: Farms are set up using in the One Identity Manager database using the Synchronization Editor.

To edit the master data of a farm

1. Select SharePoint | Farms.
2. Select the farm in the result list. Select Change master data.
3. Edit the farm's master data.
4. Save the changes.

General master data for a SharePoint farm

Enter the following master data for a farm.

Table 17: General master data for a farm

**NOTE:** If you select No synchronization, you can define custom processes to exchange data between One Identity Manager and the target system.

**Build version**

The build version for SharePoint services for this farm are read in during synchronization.

**Related topics**

- Target system managers on page 44

**Editing a synchronization project**

Synchronization projects in which a farm is already used as a base object can also be opened in Manager. You can, for example, check the configuration or view the synchronization log in this mode. The Synchronization Editor is not started with its full functionality. You cannot run certain functions, such as, running synchronization or simulation, starting the target system browser and others.

**NOTE:** Manager is locked for editing throughout. To edit objects in Manager, close the Synchronization Editor.
To open an existing synchronization project in the Synchronization Editor

1. Select SharePoint | Farms.
2. Select the farm in the result list. Select Change master data.
3. Select Edit synchronization project... from the task view.

SharePoint web applications

SharePoint web applications provide permissions for SharePoint users that are valid across all websites within the web application. You can find information about SharePoint objects that the web application is linked to on the overview form. Defined users and permissions policies are shown for the web application. Valid SharePoint providers are displayed with the web applications for which they are registered.

In SharePoint, you can limit the amount of permissions that can be assigned to SharePoint permission levels. You can see all valid permissions for the web application on the overview form.

To obtain an overview of a web application

1. Select SharePoint | Web applications.
2. Select the web application in the result list.
3. Select SharePoint web application overview in the task view.

Related topics

- SharePoint roles and permission levels on page 116
SharePoint site collections and sites

SharePoint sites are organized into site collections. A site collection manages access rights and characterization templates for all sites in the site collection. It consists of at least one site on the top level (root site). Other websites are arranged below this root site. They can be connected to hierarchies through simple task relationships. Properties (for example role definitions) can be inherited by child sites though this hierarchical structure.

Site collections and sites are mapped with their access rights to One Identity Manager. You cannot edit their properties in the One Identity Manager. You can edit access rights managed within a site collection in One Identity Manager. To do this, SharePoint roles, groups and user accounts are loaded into the One Identity Manager database.

Related topics

- SharePoint roles and groups on page 97

SharePoint site collections

A site collection groups sites together. User account and their access permissions are managed on the sites. To automatically assign used accounts and employees, assign an account definition to the site collection.

Authorized user accounts and groups are displayed on the site collection's overview as well as the web application and the root site linked to the site collection. The quota template, the site collection administrators and auditors assigned to the site collection are also visible on the overview form.

To edit site collection properties

1. Select SharePoint | Site collections.
2. Select the site collection in the result list. Select Change master data.
3. Enter the required data on the master data form.
4. Save the changes.

Specifying categories for inheriting SharePoint groups

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can be freely selected and are specified using a mapping rule. Each category is given a specific position within the template. The template contains two tables; the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions Position 1 to Position 31.

To define a category

1. In Manager, select the site collection in SharePoint | Site collections.
2. Select Change master data.
3. Switch to the Mapping rule category tab.
4. Extend the relevant roots of the user account table or group table.
5. Click ☑ to enable category.
6. Enter a category name of your choice for user accounts and groups and in the login language used.
7. Save the changes.

Additional tasks for managing sites

After you have entered the master data, you can run the following tasks.

You can view all the roles and permission levels that are valid for this site on the overview form. Use Open URL to open the site in a standard web browser. Prerequisite for this is that the server in the URL can be resolved per DNS.

To obtain an overview of an site

1. Select SharePoint | Sites.
2. Select the site in the result list.
3. Select SharePoint site overview.

Related topics

- Address data for a site on page 72

Child sites inheriting permissions

SharePoint roles are defined at site level. There are always roles defined for the root site of a site collection. Child sites can inherit these role definitions. In the same way, roles on the root site of a site collection are also assigned to groups or user accounts. These assignments can inherit child sites. Unique role definition specifies whether a site inherits roles from the parent site. Unique role assignment specifies whether user accounts and groups are explicitly authorized for a site or whether the role assignments are inherited by the parent website.
Setting up SharePoint site collections and sites

Site collections and sites are simply loaded into the One Identity Manager database through synchronization in the default installation of One Identity Manager. You can add new site collections and site in the One Identity Manager and publish them in the SharePoint target system. To do this, UID_SPSPrefix and UID_SPSWebTemplate are provided for the table SPSWeb as well as predefined scripts and processes.

NOTE: You can use the following scripts and processes to request site collections and sites from the IT Shop. Customize these scripts and processes as required!

<table>
<thead>
<tr>
<th>Script/Process</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script VI_CreateSPSSite</td>
<td>Creates a new site collection and the associate root site in the One Identity Manager database. Creates a user account that is entered as site collection administrator or root site author.</td>
</tr>
<tr>
<td>Script VI_CreateSPSWeb</td>
<td>Creates a new site within a site collection in the One Identity Manager database.</td>
</tr>
<tr>
<td>Process SP0_SPWeb_(De-)Provision</td>
<td>Creates a new site within a site collection. The process is triggered by the event PROVISION when the site in the One Identity Manager database is not labeled as the root site.</td>
</tr>
<tr>
<td>Process SP0_SPSite_(De-)Provision</td>
<td>Creates a new site collection in a web application and the associated root site. The process is triggered by the event PROVISION.</td>
</tr>
</tbody>
</table>

The following step are required in additions:

- Define a requestable product through which the site collection/site is requested in the IT Shop.
- Define product properties that are mapped to the script parameter (for example web application, prefix or site template). You must include these product properties when the site collection/site is requested.
- Create a process for the table PersonWantsOrg that is started when the request is approved (event OrderGranted). This process call the matching script and sets the
parameter values with the defined product properties you have defined. Then the site collection/site is added in the One Identity Manager database.
SharePoint user accounts

SharePoint user accounts provide the information necessary for user authentication, such as, the authentication mode and login names. In addition, permissions of users in a site collection are specified in the user accounts.

Each SharePoint user account represents an object from an authentication system trusted by the SharePoint installation. If this authentication system is managed as a target system in One Identity Manager, the SharePoint object used for authentication can be saved as the authentication object in the user policy. This means the SharePoint user account permissions are mapped to employees managed in One Identity Manager. One Identity Manager makes it possible for you to obtain an overview of all an employee's SharePoint access permissions. SharePoint permissions can be attested and checked for compliance. Employees can request or obtain the SharePoint permissions they requires through their memberships in hierarchical roles or through the Web Portal when appropriately configured.

Example

Set up guest access to a site collection with read-only permissions. To do this, a SharePoint user account is added. The Active Directory group "Guests" is assigned as authentication object to the user account. Clara Harris owns an Active Directory user account, which is a member in this group. She can log in to the site collection with this and obtain all the SharePoint user account's permissions.

Jan Bloggs is also requires guest access to the site collection. He owns an Active Directory user account in the same domain. He request membership of the Web Portal group in Active Directory. Once the request is granted approval and assigned, he can log in on the site collection.

By default, the following objects can be assigned as authentication objects in One Identity Manager.

- Active Directory groups (ADSGroup)
- Active Directory user accounts (ADSAccount)
- LDAP groups (LDAPGroup)
- LDAP user accounts (LDAPAccount)
During synchronization, One Identity Manager tries to assign the matching authentication object using the login name.

SharePoint access permissions are supplied in different ways in the One Identity Manager, depending on the referenced authentication object.

**Case 1: The associated authentication object is a group. The authentication system is managed in One Identity Manager. (Default case)**

- The user account represents an Active Directory or LDAP group. This group can be assigned in the One Identity Manager as authentication object.
- The user account cannot be assigned to an employee. This means, the user account can only become a member in SharePoint roles and groups through direct assignment.
- In order for an employee to log in on the SharePoint system, they require an Active Directory or LDAP user account. This user account must be member in the Active Directory or LDAP group.
- A new SharePoint user account can be created manually.
- The user account cannot be managed through an account definition.

**Case 2: The authentication object is a user account. The authentication system is managed in One Identity Manager.**

- The user account represents an Active Directory or LDAP user account. The user account is not assigned as an authentication object in One Identity Manager.
- The SharePoint user account can be assigned to an employee. This means that the user account can become a member in SharePoint roles and groups through inheritance and direct assignment.

  If an authentication object is assigned, the connected employee is found through the authentication object.

  If there is no authentication object assigned, the employee can be assigned automatically or manually. Automatic employee assignment depends on "TargetSystem\SharePoint\PersonAutoFullsync" and "TargetSystem\SharePoint\PersonAutoDefault".

- A new SharePoint user account can be manually created or by using an account definition. The Active Directory or LDAP user account used as authentication object must belong to a domain trusted by the referenced authentication system.
- The user account can be managed through an account definition.
Case 3: The authentication object is a user account. The authentication system is not managed in One Identity Manager.

- The user account cannot be assigned an authentication object.
- The user account can be manually or automatically assigned to an employee. This means that the user account can become a member in SharePoint roles and groups through inheritance and direct assignment. Automatic employee assignment depends on "TargetSystem\SharePoint\PersonAutoFullsync" and "TargetSystem\SharePoint\PersonAutoDefault".
- A new SharePoint user account can be manually created or by using an account definition. If an account definition is used, the column templates must be customized for SPSUser.LoginName and SPSUser.DisplayName.
- The user account can be managed through an account definition.

The basics for managing employees and user account are described in the One Identity Manager Target System Base Module Administration Guide.

**Supported user account types**

Different types of user accounts, such as default user accounts, administrative user accounts, service accounts, or privileged user accounts can be mapped in One Identity Manager.

The following properties are used for mapping different user account types.

- **Identity**
  
  The **Identity** property (IdentityType column) is used to describe the type of user account.

<table>
<thead>
<tr>
<th>Identity</th>
<th>Description</th>
<th>Value of the IdentityType column</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary identity</td>
<td>Employee’s default user account.</td>
<td>Primary</td>
</tr>
<tr>
<td>Organizational</td>
<td>Secondary user account used for different roles in the organization, for example for subcontracts with other functional areas.</td>
<td>Organizational</td>
</tr>
<tr>
<td>admin identity</td>
<td>User account with administrative permissions, used by one employee.</td>
<td>Admin</td>
</tr>
<tr>
<td>Sponsored</td>
<td>User account that is used for training purposes, for</td>
<td>Sponsored</td>
</tr>
</tbody>
</table>

The **Table 23: Identities of user accounts**
### Table: Identity and Description

<table>
<thead>
<tr>
<th>Identity</th>
<th>Description</th>
<th>Value of the IdentityType column</th>
</tr>
</thead>
<tbody>
<tr>
<td>identity example</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Shared identity</td>
<td>User account with administrative permissions, used by several employees.</td>
<td>Shared</td>
</tr>
<tr>
<td>Service identity</td>
<td>Service account.</td>
<td>Service</td>
</tr>
</tbody>
</table>

**NOTE:** To enable working with identities for user accounts, the employees also need identities. You can only link user accounts to which an identity is assigned with employees who have this same identity.

The primary identity, the organizational identity, and the personal admin identity are used for different user accounts, which can be used by the same actual employee to execute their different tasks within the company.

To provide user accounts with a personal admin identity or an organizational identity for an employee, you create subidentities for the employee. These subidentities are then linked to user accounts, enabling you to assign the required Entitlements to the different user accounts.

User accounts with a sponsored identity, group identity, or service identity are linked to dummy employees that do not refer to a real person. These dummy employees are needed so that Entitlements can be inherited by the user accounts. When evaluating reports, attestations, or compliance checks, check whether dummy employees need to be considered separately.

For detailed information about mapping employee identities, see the *One Identity Manager Identity Management Base Module Administration Guide*.

- **Privileged user account**
  
  Privileged user accounts are used to provide employees with additional privileges. This includes administrative user accounts or service accounts, for example. The user accounts are marked as **Privileged user account** (Column IsPrivilegedAccount).

### Default User Accounts

Normally, each employee obtains a default user account, which has the permissions they require for their regular work. The user accounts are linked to the employee. By default, the link between employee and SharePoint user account is set up through the authentication objects to which the user account is assigned. Alternatively, employees can also be directly linked to the user accounts. Such user accounts can be managed through account definitions. The effect of the link and the scope of the employee’s inherited properties on the user accounts can be configured through an account definition and its manage levels.
To create default user accounts through account definitions

1. Create an account definition and assign the Unmanaged and Full managed manage levels.
2. Specify the effect of temporarily or permanently disabling, deleting or the security risk of an employee on its user accounts and group memberships for each manage level.
3. Create a formatting rule for IT operating data.
   You use the mapping rule to define which rules are used to map the IT operating data for the user accounts, and which default values are used if no IT operating data can be determined via a person’s primary roles.
   Which IT operating data is required depends on the target system. The following setting are recommended for default user accounts:
   - In the mapping rule for the IsGroupAccount column, use the default value 1 and enable Always use default value.
   - In the mapping rule for the IdentityType column, use the default value Primary and enable Always use default value.
4. Enter the effective IT operating data for the target system. Select the concrete target system under Effects on.
   Specify in the departments, cost centers, locations, or business roles which IT operating data should apply when you set up a user account.
5. Assign the account definition to employees.
   When the account definition is assigned to an employee, a new user account is created through the inheritance mechanism and subsequent processing.

Administrative User Accounts

An administrative user account must be used for certain administrative tasks. Administrative user accounts are usually predefined by the target system and have fixed names and login names, such as Administrator.

Administrative user accounts are imported into One Identity Manager during synchronization.

NOTE: Some administrative user accounts can be automatically identified as privileged user accounts. To do this, enable the Mark selected user accounts as privileged schedule in Designer.

You can label administrative user accounts as a Personalized administrator identity or as a Shared identity. Proceed as follows to provide the employees who use this user account with the required permissions.

- Personalized admin identity
  1. Use the UID_Person column to link the user account with an employee.
  2. Use an employee with the same identity or create a new employee.
2. Assign this employee to hierarchical roles.
   
   • **Shared identity**
     1. Assign all employees with usage authorization to the user account.
     2. Link the user account to a dummy employee using the UID_Person column.
        Use an employee with the same identity or create a new employee.
     3. Assign this dummy employee to hierarchical roles.
        The dummy employee provides the user account with its permissions.

**Privileged User Accounts**

Privileged user accounts are used to provide employees with additional privileges. This includes administrative user accounts or service accounts, for example. The user accounts are marked as **Privileged user account** (Column IsPrivilegedAccount).

**NOTE:** The criteria according to which user accounts are automatically identified as privileged are defined as extensions to the view definition (ViewAddOn) in the TSBVAccountIsPrivDetectRule table (which is a table of the **Union** type). The evaluation is done in the script TSB_SetIsPrivilegedAccount.

**To create privileged users through account definitions**

1. Create an account definition. Create a new manage level for privileged user accounts and assign this manage level to the account definition.

2. If you want to prevent the properties for privileged user accounts from being overwritten, set the **IT operating data overwrites** property for the manage level to **Only initially**. In this case, the properties are populated just once when the user accounts is created.

3. Specify the effect of temporarily or permanently disabling or deleting, or the security risk of an employee on its user accounts and group memberships for each manage level.

4. Create a formatting rule for IT operating data.

   You use the mapping rule to define which rules are used to map the IT operating data for the user accounts, and which default values are used if no IT operating data can be determined via a person's primary roles.

   Which IT operating data is required depends on the target system. The following settings are recommended for privileged user accounts:

   • In the mapping rule for the IsPrivilegedAccount column, use the default value **1** and enable **Always use default value**.

   • You can also specify a mapping rule for the IdentityType column. The column owns different permitted values that represent user accounts.

   • To prevent privileged user accounts from inheriting the entitlements of the default user, define a mapping rule for the IsGroupAccount column with a default value of **0** and enable **Always use default value**.
5. Enter the effective IT operating data for the target system.
   Specify in the departments, cost centers, locations, or business roles which IT operating data should apply when you set up a user account.

6. Assign the account definition directly to employees who work with privileged user accounts.
   When the account definition is assigned to an employee, a new user account is created through the inheritance mechanism and subsequent processing.

   **TIP:** If customization requires that the login names of privileged user accounts follow a defined naming convention, create the template according to which the login names are formed.

### Entering SharePoint user account master data

Each SharePoint user account represents an object from an authentication system. This object can be a group or a user. The group authentication and user authenticated user accounts are select separately in the navigation system.

**To edit the properties of a group authenticated user account**

1. Select **SharePoint | User accounts (group authentication)**.
2. Select the user account in the result list and run **Change master data**.
   - OR -
   Click 🕵️‍♂️ in the result list.
3. Edit the user account's resource data.
4. Save the changes.

**To edit the properties of a user authenticated user account.**

1. Select **SharePoint | User accounts (user authentication)**.
2. Select the user account in the result list and run **Change master data**.
   - OR -
   Click 🕵️‍♂️ in the result list.
3. Edit the user account's resource data.
4. Save the changes.

**To manually assign or create a user authenticated user account for an employee**

1. Select the **Employees | Employees**.
2. Select the employee in the result list and run **Assign user accounts** in SharePoint.
3. Assign a user account.
4. Save the changes.

categories from the menu. | Advice Spare text box for additional explanation.

Identity | User account's identity type Permitted values are:

- **Primary identity**: Employee's default user account.
- **Organizational identity**: Secondary user account used for different roles in the organization, for example for subcontracts with other functional areas.
- **Personalized administrator identity**: User account with administrative entitlements, used by one employee.
- **Sponsored identity**: User account that is used for training purposes, for example.
- **Shared identity**: User account with administrative entitlements, used by several employees. Assign all employees show use the user account.
- **Service identity**: Service account.

Privileged user account | Specifies whether this is a privileged user account.

Groups can be inherited | Specifies whether the user account can inherit SharePoint roles and groups via the employee. If this option is set, the user account inherits SharePoint roles and groups via hierarchical roles or IT Shop requests.

| Specifies whether you add an employee with a user account to a department, for example, and you have assigned groups to this department, the user account inherits these groups.
| Specifies whether an employee has requested group membership in the IT Shop and the request is granted approval, the employee's user account only inherits the group if the option is set.

Administrator | Specifies whether the user account is a site collection administrator.

Auditor | Specifies whether the user account is a site collection auditor.

Additional tasks for managing SharePoint user accounts

After you have entered the master data, you can run the following tasks.

Overview of SharePoint user accounts

To obtain an overview of a user account
1. Select SharePoint | User accounts (group authenticated) or SharePoint | User accounts (user authenticated).
2. Select the user account in the result list.
3. Select SharePoint user account overview.

Assigning SharePoint groups directly to SharePoint user accounts

Groups can be assigned directly or indirectly to a user account. Indirect assignment is carried out by allocating the employee and groups in hierarchical roles, such as departments, cost centers, locations, or business roles. If the employee has a SharePoint user account, groups in the hierarchical roles are inherited by this user account. Groups can only be directly assigned to group authenticated user accounts.

Only groups from the site collection to which the user account belongs can be assigned.

To assign groups directly to user accounts
1. Select SharePoint | User accounts (group authenticated) or SharePoint | User accounts (user authenticated).
2. Select the user account in the result list.
3. Select Assign groups.
4. Assign groups in Add assignments.
   TIP: you can remove the assignment of groups in the Remove assignments area.
   To remove an assignment
   • Select the group and double click ✓.
5. Save the changes.
Assigning SharePoint roles directly to user accounts

SharePoint roles can be assigned directly or indirectly to a user account. Indirect assignment is carried out by assigning the employee and SharePoint roles to hierarchical roles, like departments, cost centers, locations, or business roles. If the employee has a SharePoint user account, the SharePoint roles in the hierarchical roles are inherited by the user account. SharePoint roles can only be directly assigned to group authenticated user accounts.

Only SharePoint roles from the site collection to which the user account belongs can be assigned.

NOTE: SharePoint roles that reference permission levels set with Hidden cannot be assigned to user accounts.

To assign SharePoint roles directly to user accounts

1. Select SharePoint | User accounts (group authenticated) or SharePoint | User accounts (user authenticated).
2. Select the user account in the result list.
3. Select Assign SharePoint roles.
4. Assign roles in Add assignments.
   - OR -
   In Remove assignments, remove the roles.
5. Save the changes.

Assigning extended properties

Extended properties are meta objects that cannot be mapped directly in One Identity Manager, for example, operating codes, cost codes or cost accounting areas.
To specify extended properties for a user account

1. Select SharePoint | User accounts (group authenticated) or SharePoint | User accounts (user authenticated).
2. Select the user account in the result list.
3. Select Assign extended properties in the task view.
4. Assign extended properties in Add assignments.
   - OR -
   Remove extended properties from Remove assignments.
5. Save the changes.

Using custom authentication modes

When user accounts are added, the values of various master data are determined using templates. One Identity Manager tries to identify and classify an authentication object using user account properties during synchronization. To use custom authentication modes, the templates of different columns must be modified if necessary. Create custom templates so that authentication modes can be assigned automatically to user accounts and the login names can be correctly formatted.

To use custom authentication modes

1. In Designer, adjust the templates for the column SPSUser.UID_SPSAuthSystem (authentication mode).
2. Test the template of columns SPSUser.ObjectKeyNamespaceItem (authentication modes) and SPSUser.LoginName (login name) and modify them if necessary.

Detailed information about this topic

- One Identity Manager Configuration Guide
Automatically assigning employees to SharePoint user accounts

Table 28: Configuration parameters for automatic employee assignment

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TargetSystem\SharePoint\PersonAutoFullSync</td>
<td>This configuration parameter specifies the mode for automatic employee assignment for user accounts added to or updated in the database through synchronization.</td>
</tr>
<tr>
<td>TargetSystem\SharePoint\PersonAutoDefault</td>
<td>This configuration parameter specifies the mode for automatic employee assignment for user accounts added to the database outside synchronization.</td>
</tr>
</tbody>
</table>

When you add a user authenticated user account, an existing employee can be assigned automatically. This mechanism can follow on after a new user account has been created manually or through synchronization. Define criteria for finding employees to apply to automatic employee assignment. If a user account is linked to an employee through the current mode, the user account is given, through an internal process, the default manage level of the account definition entered in the user account’s target system. You can customize user account properties depending on how the behavior of the manage level is defined.

If you run this procedure during working hours, automatic assignment of employees to user accounts takes place from that moment onwards. If you disable the procedure again later, the changes only affect user accounts added or updated after this point in time. Existing employee assignment to user accounts remain intact.

 insurer: It is not recommended to assign employees using automatic employee assignment in the case of administrative user accounts. Use Change master data to assign employees to administrative user account for the respective user account.

Prerequisites:
- Group authenticated is not set in the user accounts.
- The user accounts are not assigned an authentication object

Run the following tasks to assign employees automatically.
- If employees can be assigned by user accounts during synchronization, set "TargetSystem\SharePoint\PersonAutoFullSync" in Designer and select the mode.
- If employees can be assigned by user accounts during synchronization, set "TargetSystem\SharePoint\PersonAutoDefault" in Designer and select the mode.
• Assign an account definition to the site collection. Ensure that the manage level to be used is entered as the default manage level.
• Define the search criteria for employees assigned to the site collection.

NOTE:
The following applies for synchronization:
• Automatic employee assignment takes effect if user accounts are added or updated.
The following applies outside synchronization:
• Automatic employee assignment takes effect if user accounts are added.

Detailed information about this topic
• For more information, see the One Identity Manager Target System Base Module Administration Guide.

Related topics
• Creating an account definition on page 47
• Assigning account definitions to a target system on page 61
• Editing search criteria for automatic employee assignment on page 93

Editing search criteria for automatic employee assignment

The criteria for employee assignment are defined for the site collection. In this case, you specify which user account properties must match the employee’s properties such that the employee can be assigned to the user account. You can limit search criteria further by using format definitions. The search criterion is written in XML notation to the Search criteria for automatic employee assignment column (AccountToPersonMatchingRule) in the SPSSite table.

Search criteria are evaluated when employees are automatically assigned to user accounts. Furthermore, you can create a suggestion list for assignments of employees to user accounts based on the search criteria and make the assignment directly.

NOTE: When the employees are assigned to user accounts on the basis of search criteria, user accounts are given the default manage level of the account definition entered in the user account’s target system. You can customize user account properties depending on how the behavior of the manage level is defined.

It is not recommended to make assignment to administrative user accounts based on search criteria. Use Change master data to assign employees to administrative user account for the respective user account.
NOTE: One Identity Manager supplies a default mapping for employee assignment. Only carry out the following steps when you want to customize the default mapping.

**To specify criteria for employee assignment**

1. Select SharePoint | Site collections.
2. Select the site collection in the result list.
3. Select Define search criteria for employee assignment in the task view.
4. Specify which user account properties must match with which employee so that the employee is linked to the user account.

<table>
<thead>
<tr>
<th>Table 29: Standard search criteria for user accounts</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Apply to</strong></td>
</tr>
<tr>
<td>User accounts (user authenticated)</td>
</tr>
</tbody>
</table>

5. Save the changes.

**Direct assignment of employees to user accounts based on a suggestion list**

In Assignments, you can create a suggestion list for assignments of employees to user accounts based on the search criteria and make the assignment directly. User accounts are grouped in different views for this.

<table>
<thead>
<tr>
<th>Table 30: Manual Assignment View</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View</strong></td>
</tr>
<tr>
<td>Suggested assignments</td>
</tr>
<tr>
<td>Assigned user accounts</td>
</tr>
<tr>
<td>Without employee assignment</td>
</tr>
</tbody>
</table>

**TIP:** By double-clicking on an entry in the view, you can view the user account and employee master data.
To apply search criteria to user accounts

- Click Reload.
  All possible assignments based on the search criteria are found in the target system for all user accounts. The three views are updated.

To assign employees directly over a suggestion list

1. Click Suggested assignments.
   a. Click Select for all user accounts to which you want to assign the suggested employees. Multi-select is possible.
   b. Click Assign selected.
   c. Confirm the security prompt with Yes.
      The employees determined using the search criteria are assigned to the selected user accounts.

   - OR -

2. Click No employee assignment.
   a. Click Select employee for the user account to which you want to assign an employee. Select an employee from the menu.
   b. Click Select for all user accounts to which you want to assign the selected employees. Multi-select is possible.
   c. Click Assign selected.
   d. Confirm the security prompt with Yes.
      The employees displayed in the Employee column are assigned to the selected user accounts.

To remove assignments

1. Click Assigned user accounts.
   a. Click Select for all user accounts for which you want to delete the employee assignment. Multi-select is possible.
   b. Click Remove selected.
   c. Confirm the security prompt with Yes.
      The assigned employees are removed from the selected user accounts.

Deleting and restoring SharePoint user accounts

NOTE: As long as an account definition for an employee is valid, the employee retains the user account that was created by it. If the assignment of an account definition is removed, the user account that was created from this account definition is deleted.
To delete a user account

1. Select SharePoint | User accounts (group authenticated) or SharePoint | User accounts (user authenticated).
2. Select the user account in the result list.
3. Click to delete the user account.
4. Confirm the security prompt with Yes.

To restore a user account

1. Select SharePoint | User accounts (group authenticated) or SharePoint | User accounts (user authenticated).
2. Select the user account in the result list.
3. Click in the result list toolbar.

When an authentication object assigned to a SharePoint user account is deleted from the One Identity Manager database, the link to the authentication object is removed from the SharePoint user account. Define a custom process to delete these user accounts from the One Identity Manager database.

Configuring deferred deletion

By default, user accounts are finally deleted from the database after 30 days. The user accounts are initially locked. You can reenable the user accounts until deferred deletion is run. After deferred deletion is run, the user account are deleted from the database and cannot be restored anymore. You can configure an alternative deletion delay on the table SPSUser in Designer.

**NOTE:** SharePoint user accounts cannot be locked. A user account marked for deletion remains enabled until deferred deletion has expired and the user account is finally deleted from the One Identity Manager database.

Lock the user account linked to the SharePoint user account as authentication object to prevent a user from logging into a site when the SharePoint user account is marked for deletion.
SharePoint roles and groups

User accounts inherit SharePoint permissions through SharePoint roles and SharePoint groups. SharePoint groups are always defined for one site collection in this way. SharePoint roles are defined for sites. They are assigned to groups, and the user accounts that are members of these groups inherit SharePoint permissions through them. SharePoint roles can also be assigned directly to user accounts. User account permissions on individual sites in a site collection are restricted through the SharePoint roles that are assigned to it.

Terms

- A SharePoint Role is the permission level linked to a fixed site.
- The assignment of SharePoint permissions to a permission level is called a role definition.
- The assignment of user account or groups to a SharePoint role is called a role assignment.

Child sites can inherit permissions from the sites that the user accounts have on those sites. Every root site of a site collection or every site that has a child site. This permits the following scenarios:

1. The child site inherits role definitions and role assignments.
   The permission levels and role definitions are valid as well as the role assignments from the parent (inheritance) site. User and groups cannot be explicitly authorized for the site. Only user accounts that have permissions for the parent (inheritance) site have access to the site.

2. The child site inherits the role definitions and role assignments.
   You cannot define unique permission levels for child site. The SharePoint roles for this site reference the permission levels of the parent (inheritance) site and its role definitions. User accounts and groups can be assigned to the SharePoint roles of the child site based on this. If there are unique permission levels defined for the child site the permissions are overwritten by the inherited permissions.

3. The child site does not inherit role definitions or role assignments.
In this case unique permission levels with their role definitions can be added in the same way as the root site. The SharePoint roles based on the definitions are assigned to user accounts and groups.

**Figure 2: SharePoint User Accounts Inheriting SharePoint Permissions in the One Identity Manager**

SharePoint Groups

You can use groups in SharePoint to provide users with the same permissions. Groups that you add for site collections are valid for all sites in that site collection. SharePoint roles and groups
that you define for a site are assigned directly to groups. All user accounts that are members of these groups obtain the permissions defined in the SharePoint roles for this site.

You can edit the following group data in the One Identity Manager:

- Object properties like display name, owner or visibility of memberships
- Assigned SharePoint role and user accounts

### Property | Description
--- | ---
IT Shop | Specifies whether the group can be requested through the IT Shop. If this option is set, the group can be requested by the employees through the Web Portal and distributed with a defined approval process. The group can still be assigned directly to hierarchical roles.

Only for use in IT Shop | Specifies whether the group can only be requested through the IT Shop. If this option is set, the group can be requested by the employees through the Web Portal and distributed with a defined approval process. Direct assignment of the group to hierarchical roles or user accounts is no permitted.

**Detailed information about this topic**

- Specifying categories for inheriting SharePoint groups on page 70
- SharePointGroup inheritance based on categories on page 112
- One Identity Manager IT Shop Administration Guide
- One Identity Manager Risk Assessment Administration Guide

**Assigning SharePoint groups to SharePoint user accounts**

Groups can be assigned directly or indirectly to employees. In the case of indirect assignment, employees and groups are arranged in hierarchical roles. The number of groups assigned to an employee is calculated from the position in the hierarchy and the direction of inheritance.

If you add an employee to hierarchical roles and the employee owns a user authenticated user account, the user account is added to the group. Prerequisites for indirect assignment of employees to user accounts:

- For role classes, assignment of employees and groups is permitted (department, cost center, location or business role).

- **Group authenticated** is not set in the user accounts.

- The user accounts are marked with the option **Groups can be inherited**.

- User accounts and groups belong to the same site collection.

Furthermore, groups can be assigned to employees through IT Shop requests. Add employees to a shop as customers so that groups can be assigned through IT Shop requests. All groups are assigned to this shop can be requested by the customers. Requested groups are assigned to the employees after approval is granted.
Assigning SharePoint groups to departments, cost centers and locations

Assign groups to departments, cost centers, and locations in order to assign user accounts to them through these organizations.

To assign a group to departments, cost centers or locations (non role-based login)

1. In the Manager, select the SharePoint | Groups category.
2. Select the group in the result list.
3. Select Assign organizations.
4. Assign organizations in Add assignments.
   - Assign departments on the Departments tab.
   - Assign locations on the Locations tab.
   - Assign cost centers on the Cost centers tab.

TIP: In the Remove assignments area, you can remove the assignment of organizations.

To remove an assignment

- Select the organization and double click.

5. Save the changes.

To assign groups to a department, cost center or location (role-based login)

1. Select Organizations | Departments in Manager.
   - OR -
   Select Organizations | Cost centers in Manager.
   - OR -

Assigning SharePoint user accounts directly to a SharePoint group

Groups can be assigned directly or indirectly to user accounts. Indirect assignment can only be used for user authenticated user accounts. Direct assignment can only be used for group and user authenticated user accounts.

User accounts and groups must belong to the same site collection.

To assign a group directly to user accounts

1. Select SharePoint | Groups.
2. Select the group in the result list.
3. Select Assign user accounts in the task view.
4. Assign user accounts in Add assignments.
   - OR -
   - Remove user accounts from Remove assignments.
5. Save the changes.
Assigning SharePoint roles to SharePoint groups

In order for SharePoint user groups to obtain permissions for individual websites, assign SharePoint roles to the groups. SharePoint roles and groups must belong to the same site collection.

NOTE: SharePoint Roles that reference permission levels with the Hidden option enabled cannot be assigned to groups.

To assign SharePoint roles to a group

1. Select SharePoint | Groups.
2. Select the group in the result list.
3. Select Assign SharePoint roles in the task view
4. Assign roles in Add assignments.
   - OR -
   In Remove assignments, remove the roles.
5. Save the changes.

Adding SharePoint groups to system roles

Installed modules:  System Roles Module

Use this task to add a group to system roles. If you assign a system role to employees, all the user authenticated user accounts belonging to these employees inherit the group.

**NOTE:** Groups with **Only use in IT Shop** set can only be assigned to system roles that also have this option set. For more detailed information, see the *One Identity Manager System Roles Administration Guide*.

**To assign a group to system roles**

1. In the Manager, select the **SharePoint | Groups** category.
2. Select the group in the result list.
3. Select **Assign system roles in the task view**.
4. Assign system roles in **Add assignments**.

   **TIP:** In the **Remove assignments** area, you can remove the assignment of system roles.

   **To remove an assignment**
   - Select the system role and double click ☑.

5. Save the changes.

**Adding SharePoint groups to the IT Shop**

When you assign a group to an IT Shop shelf, it can be requested by the shop customers. To ensure it can be requested, further prerequisites need to be guaranteed.

- the group must be marked with the **IT Shop** option.
- the group must be assigned a service item.
TIP: In Web Portal, all products that can be requested are grouped together by service category. To make the group easier to find in Web Portal, assign a service category to the service item.

- If you only want it to be possible for the group to be assigned to employees through IT Shop requests, the group must also be labeled with the **Use only in IT Shop** option. Direct assignment to hierarchical roles or user accounts is no longer permitted.

NOTE: With role-based login, the IT Shop administrators can assign groups to IT Shop shelves. Target system administrators are not authorized to add groups to IT Shop.

**To add a group to IT Shop.**

1. In Manager select the **SharePoint | Groups** category (non-role-based login).
   - OR -
   2. In Manager, select **Entitlements | SharePoint groups** (role-based login).
2. In the result list, select the group.
3. Select **Add to IT Shop**.
4. In **Add assignments**, assign the group to the IT Shop shelves.
5. Save the changes.

**To remove a group from individual shelves of the IT Shop**

1. In Manager select the **SharePoint | Groups** category (non-role-based login).
   - OR -
   2. In Manager, select **Entitlements | SharePoint groups** (role-based login).
2. In the result list, select the group.
3. Select **Add to IT Shop**.
4. In **Remove assignments**, remove the group from the IT Shop shelves.
5. Save the changes.

**To remove a group from all shelves of the IT Shop**

1. In Manager select the **SharePoint | Groups** category (non-role-based login).
   - OR -
   2. In Manager, select **Entitlements | SharePoint groups** (role-based login).
2. In the result list, select the group.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.

The group is removed from all shelves by the One Identity Manager Service. All requests and assignment requests with this group, are canceled.
For more detailed information about request from company resources through the IT Shop, see the One Identity Manager IT Shop Administration Guide.

Adding SharePoint groups automatically to the IT Shop

Table 33: Configuration parameter for automatically add groups in the IT Shop

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QER\ITShop\GroupAutoPublish</td>
<td>Preprocessor relevant configuration parameter for automatically adding groups to the IT Shop. This configuration parameter specifies whether all Active Directory and SharePoint target system groups are automatically added to the IT Shop. The database has to be recompiled after changes have been made to the parameter.</td>
</tr>
</tbody>
</table>

To add groups automatically to IT Shop

1. Enable the QER | ITShop | GroupAutoPublish configuration parameter in Designer.
2. Compile the database.

The groups are added automatically to the IT Shop from now on.
- Synchronization ensures that the groups are added to the IT Shop. If necessary, you can manually start synchronization with the Synchronization Editor.
- New groups created in One Identity Manager are added to the IT Shop.

The following step are run to add a group to the IT Shop.
1. A service item is determined for the group.
   The service item is tested and modified for each group as required. The service item name corresponds to the name of the group. The service item is assigned to one of the default service categories.
   - The service item is modified for groups with service items.
   - Groups without service items are allocated new service items.

2. An application role for product owners is determined and the service item is assigned. Product owners can approve requests for membership in these groups. By default, the group's owner is established as product owner.

   **NOTE:** The application role for product owner must be added under the Request & Fulfillment | IT Shop | Product owner application role.

   - If the owner of the group is already a member of an application role for product owner, this application role is assigned to the service item. Therefore, all members of this application role become product owners of the group.
   - If the owner of the group is not yet a member of an application role for product owner, a new application role is created. The name of the application corresponds to the name of the owner.
     - If the owner is a user account, the user account's employee is added to the application role.
     - If it is a group of owners, the employees of all this group's user accounts are added to the application role.
   - If the group does not have an owner, the Request & Fulfillment | IT Shop | Product owner | Without owner in SharePoint default application role is used.

3. The group is labeled with the IT Shop option and assigned to the SharePoint Groups IT Shop shelf in the Identity & Access Lifecycle shop.

Then the shop customers can request group memberships through the Web Portal.

   **NOTE:** When a One Identity Manager group is irrevocably deleted from the database, the associated service item is also deleted.

Additional tasks for managing SharePoint groups

After you have entered the master data, you can run the following tasks.

Overview of SharePoint groups

Use this task to obtain an overview of the most important information about a group.

To obtain an overview of a group

1. Select SharePoint | Groups.
2. Select the group in the result list.
3. Select SharePoint group overview in the task view.

Effectiveness of group memberships

Table 34: Configuration Parameter for Conditional Inheritance

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Effect when set</th>
</tr>
</thead>
<tbody>
<tr>
<td>QER</td>
<td>Preprocessor relevant configuration parameter for controlling effectiveness of group memberships. If the parameter is set, memberships can be reduced on the basis of exclusion definitions.</td>
</tr>
<tr>
<td>Structures</td>
<td>Inherite</td>
</tr>
</tbody>
</table>

When groups are assigned to user accounts an employee may obtain two or more groups, which are not permitted in this combination. To prevent this, you can declare mutually exclusive groups. To do this, you specify which of the two groups should apply to the user accounts if both are assigned.

It is possible to assign an excluded group directly, indirectly or by IT Shop request at any time. One Identity Manager determines whether the assignment is effective.

NOTE:

- You cannot define a pair of mutually exclusive groups. That means, the definition "Group A excludes group B" AND "Group B excludes groups A" is not permitted.
- You must declare each group to be excluded from a group separately. Exclusion definitions cannot be inherited.

The effectiveness of the assignments is mapped in the SPSUserInSPSGroup and BaseTreeHasSPSGroup via the column XIsInEffect.
Example of the effect of group memberships

- The groups A, B and C are defined in a site collection.
- Group A is assigned through the department "Marketing", group B through "Finance" and group C through the business role "Control group".

Clara Harris has a user account in this site collection. She primarily belongs to the department "marketing". The business role "Control group" and the department "Finance" are assigned to her secondarily. Without an exclusion definition, the user account obtains all the permissions of groups A, B and C.

By using suitable controls, you want to prevent an employee from obtaining authorizations of groups A and group B at the same time. That means, groups A, B and C are mutually exclusive. A user, who is a member of group C cannot be a member of group B at the same time. That means, groups B and C are mutually exclusive.

Table 35: Specifying excluded groups (table SPSGroupExclusionAADGroupExclusion)

<table>
<thead>
<tr>
<th>Effective Group</th>
<th>Excluded Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group A</td>
<td>Group A</td>
</tr>
<tr>
<td>Group B</td>
<td>Group A</td>
</tr>
<tr>
<td>Group C</td>
<td>Group B</td>
</tr>
</tbody>
</table>

Table 36: Effective Assignments

<table>
<thead>
<tr>
<th>Employee</th>
<th>Member in Role</th>
<th>Effective Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ben King</td>
<td>Marketing</td>
<td>Group A</td>
</tr>
<tr>
<td>Jan Bloggs</td>
<td>Marketing, finance</td>
<td>Group B</td>
</tr>
<tr>
<td>Clara Harris</td>
<td>Marketing, finance, control group</td>
<td>Group C</td>
</tr>
<tr>
<td>Jenny Basset</td>
<td>Marketing, control group</td>
<td>Group A, Group C</td>
</tr>
</tbody>
</table>

Only the group C assignment is in effect for Clara Harris. It is published in the target system. If Clara Harris leaves the business role "control group" at a later date, group B also takes effect.

The groups A and C are in effect for Jenny Basset because the groups are not defined as mutually exclusive. If this should not be allowed, define further exclusion for group C.
Table 37: Excluded groups and effective assignments

<table>
<thead>
<tr>
<th>Employee</th>
<th>Member in Role</th>
<th>Assigned Group</th>
<th>Excluded Group</th>
<th>Effective Group</th>
</tr>
</thead>

<td>Group C</td>
</tr>
<tr>
<td></td>
<td>Control group</td>
<td>Group C</td>
<td>Group B</td>
<td>Group A</td>
</tr>
</tbody>
</table>

Prerequisites

- The configuration parameter **QER | Structures | Inherit | GroupExclusion** is enabled.
- Mutually exclusive groups belong to the same site collection.

To exclude a group

1. In the Manager, select the **SharePoint | Groups** category.
2. Select a group in the result list.
3. Select **Exclude groups**.
4. Assign the groups that are mutually exclusive to the selected group in **Add assignments**.
   - OR -
   In **Remove assignments**, remove the groups that are not longer mutually exclusive.
5. Save the changes.

SharePointGroup inheritance based on categories

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can be freely selected and are specified using a mapping rule. Each category is given a specific position within the template. The template contains two tables: the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions **Position 1** to **Position 31**.

Every user account can be assigned to one or more categories. Each group can also be assigned to one or more categories. The group is inherited by the user account when at least one user account category item matches an assigned group. The group is also inherited by the user account if the group or the user account is not put into categories.
NOTE: Inheritance through categories is only taken into account when groups are assigned indirectly through hierarchical roles. Categories are not taken into account when groups are directly assigned to user accounts.

Table 38: Category Examples

<table>

Assigning extended properties to a SharePoint group

Extended properties are meta objects that cannot be mapped directly in One Identity Manager, for example, operating codes, cost codes or cost accounting areas.

To specify extended properties for a group
1. In the Manager, select the SharePoint | Groups category.
2. Select the group in the result list.
3. Select Assign extended properties.
4. Assign extended properties in Add assignments.
   - **TIP:** In the Remove assignments area, you can remove the assignment of extended properties.
     To remove an assignment
   - Select the extended property and double click.
5. Save the changes.

For more detailed information about setting up extended properties, see the One Identity Manager Identity Management Base Module Administration Guide.

Deleting SharePoint groups

To delete a group
1. Select SharePoint | Groups.
2. Select the group in the result list.
3. Click to delete the group.
4. Confirm the security prompt with Yes.

The group is deleted completely from the One Identity Manager database and from SharePoint.
SharePoint roles and permission levels

You can define so-called permission levels in SharePoint to grant permissions to objects in a site. These permission levels group together different SharePoint permissions. Permission levels with a unique reference to a site are mapped in the One Identity Manager database as SharePoint roles. You can assign SharePoint roles through groups, or directly to user accounts. SharePoint users obtain their permissions for site objects in this way.

Figure 4: SharePoint Roles and Permission Levels in the One Identity Manager
Entering master data for SharePoint permission levels

To edit master data for a permission level

1. Select SharePoint | Permission levels.
2. Select the permission level in the result list. Select Change master data.
   - OR -
   Click in the result list.
3. Enter the required data on the master data form.
4. Save the changes.

Enter the following properties for a permission level on the master data form:

Table 39: Properties of a permission level

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permission level</td>
<td>Name of the permissions level.</td>
</tr>

<td>assigned to user accounts or groups.</td>
</tr>
</tbody>
</table>

Additional tasks for managing SharePoint permission levels

After you have entered the master data, you can run the following tasks.

Overview of a SharePoint permission level

To obtain an overview of a permission level

1. Select SharePoint | Permission levels.
2. Select the permission level in the result list.
3. Select SharePoint permission level overview.
Assigning permissions

You can assign SharePoint permission levels in One Identity Manager. Only valid permissions for web applications can be assigned. User account obtain these site permissions through a SharePoint internal inheritance procedure.

Permissions may depend on other permissions. SharePoint assigns these dependent permissions automatically. For example, the permissions "view pages", "browse user information", and "open" are always passed down with the permission "create groups".

**NOTE:** Dependent permissions cannot be automatically assigned in the One Identity Manager.

To assign permissions to permission levels

1. Select SharePoint | Permission levels.
2. Select the permission level in the result list.
3. Select Assign permission in the task view.
4. In Add assignments, assign the permissions.
   - OR -
   In Remove assignments, remove the permissions.
5. Save the changes.

Related topics

- SharePoint roles and groups on page 97

Special synchronization cases for valid permissions

If you remove permissions from the list of valid permissions for a web application in SharePoint, the permissions cannot be assigned to permission levels within the web application from this point on. Assignments to permission levels that already exist for these permissions remain intact but are not active. These permissions are deleted from the table SPSWebAppHasPermission during synchronization. Assignments to permission levels that already exist for these permissions are not changed. Inactive permissions are displayed in the permission levels' overview.
Entering master data for SharePoint roles

</tbody>
</table>

**NOTE:** If the SharePoint role references a permission level for which the Hidden option is set, the options IT Shop and Only use in IT Shop cannot be set. You cannot assign these SharePoint roles to user accounts or groups.

**Detailed information about this topic**

- Entering master data for SharePoint permission levels on page 117
- One Identity Manager IT Shop Administration Guide
- One Identity Manager Risk Assessment Administration Guide

**Assigning SharePoint roles to SharePoint user accounts**

SharePoint roles can be assigned directly or indirectly to user accounts. In the case of indirect assignment, employees and SharePoint roles are arranged in hierarchical roles. The number of SharePoint roles assigned to an employee is calculated from the position in the hierarchy and the direction of inheritance. If you add an employee to hierarchical roles and the employee owns a user authenticated user account, the user account is added to the SharePoint role. Prerequisites for indirect assignment of employees to user accounts:

- For role classes, assignment of employees and groups is permitted (department, cost center, location or business role).
- **Group authenticated** is not set in the user accounts.
- The user accounts are marked with the option **Groups can be inherited**.
- User accounts and SharePoint groups belong to the same site collection.

Furthermore, IT Shop roles can be assigned to employees through SharePoint requests. Add employees to a shop as customers so that SharePoint roles can be assigned through IT Shop requests. All SharePoint roles, which are assigned to this shop as products, can be requested by the customers. Requested SharePoint roles are assigned to the employees after approval is granted.

**NOTE:** SharePoint roles that reference permission levels with have Hidden set, cannot be assigned to business roles and organizations. These SharePoint roles can be neither directly nor indirectly assigned to user accounts or groups.
Assigning SharePoint roles to departments, cost centers and locations

Assign SharePoint roles to departments, cost centers and locations in order to assign user accounts to them through these organizations.

**To assign a SharePoint role to departments, cost centers, or locations (non role-based login)**

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select Assign organizations.
4. Assign organizations in Add assignments.
   - Assign departments on the Departments tab.
   - Assign locations on the Locations tab.
   - Assign cost centers on the Cost centers tab.

   **TIP:** In the Remove assignments area, you can remove the assignment of organizations.

   **To remove an assignment**
   - Select the organization and double click ✓.

5. Save the changes.

**To assign SharePoint roles to departments, cost centers or locations (role-based login)**

1. Select Organizations | Departments.
   - OR -
Select the category **Organizations | Cost centers.**
- OR -
Select the category **Organizations | Locations.**

2. Select the department, cost center or location in the result list.
3. Select **Assign SharePoint roles.**
4. Assign SharePoint roles in **Add assignments.**
   - OR -
   In **Remove assignments,** remove the SharePoint roles.
5. Save the changes.

**SharePoint Assigning roles to business roles**

*Installed modules:* Business Roles Module

You assign SharePoint roles to business roles in order to assign them to user accounts over business roles.

**To assign a SharePoint role to business roles (non role-based login)**

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select **Assign business roles** in the task view.
4. Assign business roles in **Add assignments.**
   - OR -
   Remove the business roles in **Remove assignments.**
5. Save the changes.
To assign SharePoint roles to a business role (non role-based login)

1. Select the category Business roles | <Role class>.
2. Select the business role in the result list.
3. Select Assign SharePoint roles in the task view.
4. Assign SharePoint roles in Add assignments.
   - OR -  
   In Remove assignments, remove the SharePoint roles.
5. Save the changes.

Assigning SharePoint user accounts directly to a SharePoint role

SharePoint roles can be assigned directly or indirectly to user accounts. Indirect assignment can only be used for user authenticated user accounts. Direct assignment can only be used for group and user authenticated user accounts.

User accounts and SharePoint roles must belong to the same site collection.

**NOTE:** SharePoint roles that reference permission levels and have the option hidden set, cannot be assigned to user accounts.

To assign a SharePoint role directly to user accounts

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select Assign user accounts in the task view.
4. Assign user accounts in Add assignments.
   - OR -  
   Remove user accounts from Remove assignments.
5. Save the changes.
Assigning SharePoint groups to SharePoint roles

In order for SharePoint user groups to obtain permissions for individual websites, assign SharePoint roles to the groups. SharePoint roles and groups must belong to the same site collection.

**NOTE:** SharePoint Roles that reference permission levels with the Hidden option enabled cannot be assigned to groups.

**To assign groups to a SharePoint role**

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select Assign groups in the task view.
4. Assign groups in Add assignments.
   - OR -
   - Remove groups from Remove assignments.
5. Save the changes.

Adding SharePoint roles to system roles

Installed modules: System Roles Module

Use this task to add a SharePoint role to system roles. If you assign a system role to employees, all the employees' user authenticated user accounts inherit the SharePoint role.

**NOTE:** If the SharePoint role references a permission level for which the **Hidden** option is enabled, system roles cannot be assigned. These SharePoint roles cannot be assigned to user accounts or groups, either directly or indirectly. For more information, see Entering master data for SharePoint permission levels on page 117.

**NOTE:** SharePoint roles with the option **Only use in IT Shop** set, can only be assigned to system roles that also have this option set. For more information, see the One Identity Manager System Roles Administration Guide.

To assign a SharePoint role to system roles

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select **Assign system roles** in the task view.
4. Assign system roles in **Add assignments**.
   - **TIP:** In the **Remove assignments** area, you can remove the assignment of system roles.

   **To remove an assignment**
   - Select the system role and double click 🗑.
5. Save the changes.

- Adding SharePoint roles to the IT Shop on page 125

Adding SharePoint roles to the IT Shop

Once a SharePoint role has been assigned to an IT Shop shelf, it can be requested by the shop customers. To ensure it can be requested, further prerequisites need to be...
guaranteed.

- The SharePoint role must be labeled with the option **IT Shop**.
- The SharePoint role must be assigned to a service item.
- The SharePoint role must be also labeled with **Only use in** IT Shop if the SharePoint role can only be assigned to employees using IT Shop requests. Direct assignment to hierarchical roles may not be possible.

**NOTE:** IT Shop administrators can assign SharePoint roles to IT Shop shelves in the case of role-based login. Target system administrators are not authorized to add SharePoint roles in the IT Shop.

### To add a SharePoint role to the IT Shop

1. Select **SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles**.
2. Select the role in the result list.
3. Select **Add to IT Shop**.
4. Assign the IT Shop shelves in **Add assignments**.
5. Save the changes.

### To remove a SharePoint role from individual IT Shop shelves

1. Select **SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles**.
2. Select the role in the result list.
3. Select **Add to IT Shop**.
4. Remove the group from the IT Shop shelves in **Remove assignments**.
5. Save the changes.

### To remove a SharePoint roles from all IT Shop shelves

1. Select **SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles**.
2. Select the role in the result list.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.

The SharePoint role is removed from all shelves by the One Identity Manager Service. All requests and assignment requests are canceled along with the SharePoint role as a result.

Additional tasks for managing SharePoint roles

After you have entered the master data, you can run the following tasks.

Overview of SharePoint roles

To obtain an overview of a SharePoint role

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select SharePoint role overview in the task view.

Effectiveness of SharePoint roles

The behavior described under Effectiveness of group memberships on page 110 can also be used for SharePoint roles.

The effect of the assignments is mapped in the tables SPSUserHasSPSRLAssign and BaseTreeHasSPSRLAssign though the column XIsInEffect.

Prerequisites

- The configuration parameter "QER\Structures\Inherite\GroupExclusion" is enabled.
- Mutually exclusive SharePoint roles belong to the same site collection.

To exclude SharePoint roles

1. Select SharePoint | Hierarchical view | <Farm> | Web applications | <web application> | <site collection> | <site> | Roles.
2. Select the role in the result list.
3. Select **Exclude SharePoint roles** in the task view.
4. Assign the roles that are mutually exclusive to the selected role in **Add assignments**.
   - OR -
   In the **Remove assignments** view, remove the roles that no longer exclude each other.
5. Save the changes.

**Detailed information about this topic**

- Effectiveness of group memberships on page 110

**Deleting SharePoint roles and permission levels**

You cannot delete SharePoint roles in the Manager. They are deleted by the DBQueue Processor when the associated permission level is deleted.

**To delete a permission level**

1. Select **SharePoint | Permission levels**.
2. Select the permission level in the result list.
3. Click 🗑 to delete the permission level.
4. Confirm the security prompt with Yes.

If deferred deletion is configured, the permission level is marked for deletion and finally deleted after the deferred deletion period has expired. During this period, the permission level can be restored. Permission levels with deferred deletion of 0 days are deleted immediately.

**To restore a permission level**

1. Select **SharePoint | Permission levels**.
2. Select the permission level marked for deletion in the result list.
3. Click 🗑 in the result list.

**Related topics**

- One Identity Manager Configuration Guide
Permissions for SharePoint web applications

You can define user policies in SharePoint that guarantee permissions across all sites in a site collection. These user policies overlay all the permissions that are specially defined for the sites. User policies are based on authentication objects from which SharePoint user accounts are created. These authentication objects can be saved as authentication objects in user policies.

User policies obtain their permissions through permission policies. SharePoint permissions are explicitly granted or denied in permission policies.

Figure 5: Permissions for SharePoint Web Applications through Policies

You define user policies and permission policies for a web application. User policies are therefore implicitly authorized for all web application sites. You can limit them to single zones or be allow them for the entire web application.
SharePoint Permission policies

On the permission policy overview form, you can view the web application and the user policies to which the permission policy is assigned. All permissions are listed that have been explicitly granted or denied.

To obtain an overview of a permission policy

1. Select SharePoint | Permission policies.
2. Select the permission policy from the result list.
3. Select SharePoint permission policy overview in the task view.

The denied SharePoint permission "Deny write" is displayed. SharePoint groups internally several single permissions together that are only found as single permissions in the SharePoint interface. The One Identity Manager maps the SharePoint internal permission. That is why only the permission "Deny write" appears in the One Identity Manager interface. Single permissions are therefore not known to the One Identity Manager.

SharePoint User policies

User policies have a dynamic foreign key (column AuthenticationObject) that references the appropriate authentication object. An additional employee can be assigned if the dynamic foreign key references an Active Directory or an LDAP user account.

Each user policy represents an object from an authentication system. This object can be a group or a user.

To edit user policy master data

1. Select SharePoint | User policies.
2. Select the SharePoint role in the result list. Select Change master data.
3. Enter the required data on the master data form.
4. Save the changes.

The following properties are displayed for user policies.

Table 42: Master data for a user policy

<table>
<thead>
<tr>
<th>Property</th>

</tr>
<tr>
<td>Web application</td>
<td>Unique identifier for the web application for which the user policy is setup.</td>
</tr>
<tr>
<td>Zone</td>
<td>Unique identifier of the SharePoint zone for which the user policy is valid.</td>
</tr>
</tbody>
</table>
| Authentication object     | Authentication object referencing the user policy. Each user policy represents an object from an authentication system trusted by the SharePoint installation. If this authentication system is managed as a target system in One Identity Manager, the object used for authentication can be saved as the authentication object in the user policy. The authentication object is assigned during automatic synchronization. If the option **User account** is set, the following authentication objects can be assigned:  
  - Active Directory User accounts  
  - LDAP User accounts  
  If the **User account** option is disabled, the following authentication objects can be assigned:  
    - Active Directory Groups  
    - LDAP groups |

**NOTE:** When an authentication object assigned to a SharePoint user policy is deleted from the One Identity Manager database, the link to the authentication object is removed from the user policy. Employees assigned to it remain assigned if necessary.

**Global user policies**

Global user polices are user policies that are valid for all zones. They are mapped in **SharePoint | Hierarchical view | <farm> | Web applications | <web application> | Global user policies.**
Zone-specific user policies

Zone specific user policies are user policies that are valid for a single zone in a web application. They are displayed in SharePoint | Hierarchical view | <farm> | Web applications | <web application> | Zone specific user policies | <zone>.
Reports about SharePoint site collections

One Identity Manager makes various reports available containing information about the selected base object and its relations to other One Identity Manager database objects. The following reports are available for SharePoint farms.

**NOTE:** Other sections may be available depending on the which modules are installed.

### Overview of all assignments

The **Overview of all assignments** report is displayed for some objects, such as authorizations, compliance rules, or roles. The report finds all the roles, for example, departments, cost centers, locations, business roles and IT Shop structures in which there are employee who own the selected base object. In this case, direct as well as indirect base object assignments are included.

#### Examples

- If the report is created for a resource, all roles are determined in which there are employees with this resource.
- If the report is created for a group or another system entitlement, all roles are determined in which there are employees with this group or system entitlement.
- If the report is created for a compliance rule, all roles are determined in which there are employees who violate this compliance rule.
- If the report is created for a department, all roles are determined in which employees of the selected department are also members.
- If the report is created for a business role, all roles are determined in which employees of the selected business role are also members.

#### To display detailed information about assignments

- To display the report, select the base object from the navigation or the result list and select the report **Overview of all assignments**.
- Click the **Used by** button in the report toolbar to select the role class for which you want to determine whether roles exist that contain employees with the selected base object.
  
  All the roles of the selected role class are shown. The color coding of elements identifies the role in which there are employees with the selected base object. The meaning of the report control elements is explained in a separate legend. To access the legend, click the **i** icon in the report’s toolbar.
- Double-click a control to show all child roles belonging to the selected role.
- By clicking the **v** button in a role’s control, you display all employees in the role with the base object.
- Use the small arrow next to ⬤ to start a wizard that allows you to bookmark this list of employee for tracking. This creates a new business role to which the employees are assigned.

Appendix: Default project template for SharePoint

A default project template ensures that all required information is added in One Identity Manager. This includes mappings, workflows and the synchronization base object. If you do not use a default project template you must declare the synchronization base object in One Identity Manager yourself.

Use a default project template for initially setting up the synchronization project. For custom implementations, you can extend the synchronization project with the Synchronization Editor.

The template uses mappings for the following schema types.
