Managing Universal Cloud Interface environments

One Identity Manager supports the implementation of Identity and Access Governance demands in IT environments, which are often a mix of traditional, internally hosted applications and modern cloud applications. Users and entitlements from cloud applications can be mapped in One Identity Manager. This makes it possible to also use Identity and Access Governance processes such as attestation, identity audit, management of users and system entitlements, IT Shop, or report subscriptions for cloud applications.

Data protection policies, such as the General Data Protection Regulation, require agreement as to which employee data can be stored in cloud applications. If the system environment is configured appropriately, One Identity Manager guarantees that cloud applications and their administrators have no access to any employee master data or Identity and Access Governance processes respectively. For this reason, cloud applications are managed in two separate modules, which can be installed in separate databases if necessary.

The Universal Cloud Interface Module provides the interface through which users and permissions can be transferred from cloud applications to a One Identity Manager database. Synchronization with the cloud applications is configured and executed at this stage. Each cloud application is mapped as its own base object in One Identity Manager. The user data is saved as user accounts, groups and permissions controls and can be organized into containers. They cannot be edited in One Identity Manager. There is no connection made to identities (employees).

Identities are connected in the Cloud Systems Management Module; user accounts, groups and permissions controls can be created and edited. This allows Identity and Access Governance processes to be used for managing cloud user accounts and their permissions. Data is exchanged between the Universal Cloud Interface and Cloud System Management modules by synchronization. Provisioning processes ensure that object changes are transferred from the Cloud Systems Management Module to the Universal Cloud Interface Module.

Automated interfaces for provisioning changes from the Universal Cloud Interface Module to the cloud application can (on technical grounds) or should (due to too few changes) not be applied to certain cloud applications. In this case, changes can be manually provisioned. Because only data that must be available in the cloud application is saved in the Universal Cloud Interface Module, the module can be installed in a separate database. This database may be outside the company's infrastructure.
The One Identity Starling Connect cloud solution provides a simple and comprehensive solution for integrating cloud applications and for meeting the requirements of hybrid solution scenarios.

**Architecture overview**

A synchronization server installed with the Universal Cloud Interface Module connector is required for synchronizing cloud applications in the Universal Cloud Interface. The Universal Cloud Interface Module can exist in the same One Identity Manager database in which the Cloud Systems Management Module is installed. Synchronization can also be set up with another One Identity Manager database, which is provided on an external database server.

**Figure 1: Architecture for synchronization**

![Architecture for synchronization diagram]

For more detailed information about communicating between the Universal Cloud Interface and cloud application, see the One Identity Manager Administration Guide for Connecting to Cloud Applications.

**One Identity Manager users for managing cloud target systems**

The following users are used for setting up and managing cloud target systems.
### Table 1: Users

</table>
Setting up synchronization with a cloud application in the Universal Cloud Interface

Data is exchanged between the Universal Cloud Interface and Cloud System Management modules by synchronization. In order to apply Identity and Data Governance processes to cloud application objects, you must set up synchronization between the two modules.

**NOTE:** The terms "target system" and "(One Identity Manager) database" are used frequently in the following. The term "target system" always means a cloud application in the Universal Cloud Interface. "One Identity Manager database" or "database" refers to the objects in the Cloud Systems Management Module.

### Table 2: Terms

<table>
<thead>
<tr>
<th>One Identity Manager database</th>
<th>Target system</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected system</td>
<td>Universal Cloud Interface Module</td>
</tr>
<tr>
<td>Base object</td>
<td>Cloud target system</td>
</tr>
<tr>
<td></td>
<td>Cloud application</td>
</tr>
</tbody>
</table>

The mapping defines how schema types of the connection systems are mapped to each other. For more information, see Appendix: Default project template for cloud applications in the Universal Cloud Interface on page 131.

**To transfer objects from a cloud application into the Cloud Systems Management Module for the first time**

1. Provide One Identity Manager users with the required permissions for setting up synchronization and post-processing of synchronization objects.
2. The One Identity Manager components for managing cloud target systems are available if the configuration parameter "TargetSystem\CSM" is set.
   - Check whether the configuration parameter is set in the Designer. Otherwise, set the configuration parameter and compile the database.
Other configuration parameters are installed when the module is installed. Check the configuration parameters and modify them as necessary to suit your requirements.

3. Install and configure a synchronization server and declare the server as Job server in One Identity Manager.

4. Create a synchronization project with the Synchronization Editor.
   The cloud application must already be available in the Universal Cloud Interface Module.

Detailed information about this topic
- Users and permissions for synchronizing on page 12
- Setting up the synchronization server on page 13
- Creating a synchronization project for initial synchronization of a cloud application on page 16

For more detailed information about setting up initial synchronization with a cloud application, see the One Identity Manager Administration Guide for Connecting to Cloud Applications.

Users and permissions for synchronizing

The following users are involved in synchronizing One Identity Manager with a cloud application in the Universal Cloud Interface.

**Table 3: Users for synchronization**

<table>
<thead>
<tr>
<th>Users</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users for accessing the Cloud Application in the Universal Cloud Interface</td>
<td>To log on to the database containing the Universal Cloud Interface, use:</td>
</tr>
<tr>
<td></td>
<td>- Role-based login: a user with the application role **Universal Cloud Interface</td>
</tr>
<tr>
<td></td>
<td>- OR -</td>
</tr>
<tr>
<td></td>
<td>- Non role-based login: a system user with the permissions group &quot;DPR_EditRights_Methods&quot;.</td>
</tr>
<tr>
<td>One Identity Manager Service user account</td>
<td>The user account for One Identity Manager Service requires rights to carry out operations at file level, for example, assigning user rights and creating and editing directories and files.</td>
</tr>
</tbody>
</table>
### Users Permissions

The user account must belong to the **Domain users** group.

The user account must have the **Login as a service** extended user right.

The user account requires access rights to the internal web service.

**NOTE:** If One Identity Manager Service runs under the network service (**NT Authority\NetworkService**), you can issue access rights for the internal web service with the following command line call:

```
netsh http add urlacl url=http://<IP address>:<port number>/ user="NT AUTHORITY\NETWORKSERVICE"
```

The user account needs full access to the One Identity Manager Service installation directory in order to automatically update the One Identity Manager.

In the default installation the One Identity Manager is installed under:

- `%ProgramFiles(x86)%\One Identity` (on 32-bit operating systems)
- `%ProgramFiles%\One Identity` (on 64-bit operating systems)

| User for accessing the One Identity Manager database | The **Synchronization** default system user is provided for executing synchronization with an application server. |

### Setting up the synchronization server

A server with the following software must be available for setting up synchronization:

- One Identity Manager Service
  - Install One Identity Manager components with the installation wizard.
    1. Select **Select installation modules with existing database**.
    2. Select the **Server | Job server** machine role.

For more detailed information about system requirements for installing the One Identity Manager Service, see the **One Identity Manager Installation Guide**.

The synchronization server must be declared as a Job server in One Identity Manager.

Use the One Identity Manager Service to install the Server Installer. The program executes the following steps:
- Setting up a Job server.
- Specifying machine roles and server function for the Job server.
- Remote installation of One Identity Manager Service components corresponding to the machine roles.
- Configuration of One Identity Manager Service.
- Starts the One Identity Manager Service.

**NOTE:** The program executes remote installation of the One Identity Manager Service. Local installation of the service is not possible with this program. Remote installation is only supported within a domain or a trusted domain.

For remote installation of One Identity Manager Service, you require an administrative workstation on which the One Identity Manager components are installed. For detailed information about installing a workstation, see the One Identity Manager Installation Guide.

**To install and configure One Identity Manager Service remotely on a server**

1. Start the program Server Installer on your administrative workstation.
2. Enter the valid connection credentials for the One Identity Manager database on the Database connection page.
3. Specify the server on which you want to install One Identity Manager Service on the Server properties page.
   a. Select a Job server from the Server menu.
      - OR -
      To create a new Job server, click Add.
   b. Enter the following data for the Job server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Job server name.</td>
</tr>
<tr>
<td>Queue</td>
<td>Name of the queue to handle the process steps. Each One Identity Manager Service within the network must have a unique queue identifier. The process steps are requested by the job queue using exactly this queue name. The queue identifier is entered in the One Identity Manager Service configuration file.</td>
</tr>
<tr>
<td>Full server name</td>
<td>Full server name in accordance with DNS syntax. Example:</td>
</tr>
<tr>
<td></td>
<td>&lt;Name of servers&gt;.&lt;Fully qualified domain name&gt;</td>
</tr>
</tbody>
</table>
5. Select Universal Cloud Interface connector on the Server functions page.
6. Check the One Identity Manager Service configuration on the Service settings page.

**NOTE:** The initial service configuration is predefined already. If further changes need to be made to the configuration, you can do this later with the Designer. For detailed information about configuring the service, see the *One Identity Manager Configuration Guide*.

7. To configure remote installations, click Next.
8. Confirm the security prompt with Yes.
9. Select the directory with the install files on Select installation source.
10. Select the file with the private key on the page Select private key file.

**NOTE:** This page is only displayed when the database is encrypted.

11. Enter the service’s installation data on the Service access page.

### Table 5: Installation data

<table>
<thead>
<tr>
<th>Data</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer</td>
<td>Server on which to install and start the service from.</td>
</tr>
<tr>
<td></td>
<td><strong>To select a server</strong></td>
</tr>
<tr>
<td></td>
<td>- Enter a name for the server.</td>
</tr>
<tr>
<td></td>
<td>- OR -</td>
</tr>
<tr>
<td></td>
<td>- Select a entry from the list.</td>
</tr>
<tr>
<td>Service account</td>
<td>User account data for the One Identity Manager Service.</td>
</tr>
<tr>
<td></td>
<td><strong>To enter a user account for the One Identity Manager Service</strong></td>
</tr>
<tr>
<td></td>
<td>- Set the option Local system account.</td>
</tr>
<tr>
<td></td>
<td>This starts the One Identity Manager Service under the NT AUTHORITY\SYSTEM account.</td>
</tr>
<tr>
<td></td>
<td>- OR -</td>
</tr>
<tr>
<td></td>
<td>- Enter user account, password and password confirmation.</td>
</tr>
<tr>
<td>Installation account</td>
<td>Data for the administrative user account to install the service.</td>
</tr>
<tr>
<td></td>
<td><strong>To enter an administrative user account for installation</strong></td>
</tr>
</tbody>
</table>
12. Click **Next** to start installing the service.

Installation of the service occurs automatically and may take some time.

13. Click **Finish** on the last page of Server Installer.

**NOTE:** The service is entered with the name **One Identity Manager Service** in the server service management.

### Creating a synchronization project for initial synchronization of a cloud application

Use the Synchronization Editor to set up synchronization between the Cloud Systems Management Module and the Universal Cloud Interface Module. The following describes the steps for initial configuration of a synchronization project.

After the initial configuration, you can customize and configure workflows within the synchronization project. Use the workflow wizard in the Synchronization Editor for this. The Synchronization Editor also provides different configuration options for a synchronization project.

Have the following information available for setting up a synchronization project.

#### Table 6: Information Required for Setting up a Synchronization Project

<table>
<thead>
<tr>
<th>Data</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud application</td>
<td>Name of the cloud application in the Universal Cloud Interface Module to synchronize.</td>
</tr>
<tr>
<td>Synchronization server</td>
<td>All One Identity Manager Service actions are executed against the target system environment on the synchronization server. Data entries required for synchronization and administration with the One Identity Manager database are processed by the synchronization server. The One Identity Manager Service with the Universal Cloud Interface connector must be installed on the synchronization server.</td>
</tr>
</tbody>
</table>
The synchronization server must be declared as a Job server in One Identity Manager. Use the following properties when you set up the Job server.

### Table 7: Additional properties for the Job server

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server function</td>
<td>Universal Cloud Interface connector</td>
</tr>
<tr>
<td>Machine role</td>
<td>Server/Job server</td>
</tr>
</tbody>
</table>

For more information, see Setting up the synchronization server on page 13.

### One Identity Manager database connection data

- Database server
- Database
- SQL Server Login and password
- Specifies whether integrated Windows authentication is used. This type of authentication is not recommended. If you decide to use it anyway, ensure that your environment supports Windows authentication.

### Remote connection server

To configure synchronization with a target system, One Identity Manager must load the data from the target system. One Identity Manager communicates directly with target system to do this. Sometimes direct access from the workstation on which the Synchronization Editor is installed is not possible, because of the firewall configuration, for example, or because the workstation does not fulfill the necessary hardware and software requirements. If direct access to the workstation is not possible, you can set up a remote connection.

The remote connection server and the workstation must be in the same Active Directory domain.

Remote connection server configuration:

- One Identity Manager Service is started
- RemoteConnectPlugin is installed
- Universal Cloud Interface connector is installed

The remote connection server must be declared as a Job server in One Identity Manager. The Job server name is required.

For more detailed information about setting up a remote connection, see the One Identity Manager Target System Synchronization Reference Guide.
NOTE: The following sequence describes how you configure a synchronization project if Synchronization Editor is both:
- executed in default mode, and
- started from the launchpad

If you execute the project wizard in expert mode or directly from Synchronization Editor, additional configuration settings can be made. Follow the project wizard instructions through these steps.

**To set up initial synchronization project for a cloud application**

1. Start the Launchpad and log on to the One Identity Manager database.
   
   NOTE: If synchronization is executed by an application server, connect the database through the application server.

2. Select **Target system type Universal Cloud Interface** and click **Start**.
   This starts the Synchronization Editor's project wizard.

3. On the **System access** page, specify how One Identity Manager can access the target system.
   - If access is possible from the workstation on which you started Synchronization Editor, you do not need to make any settings.
   - If access is not possible from the workstation on which you started Synchronization Editor, you can set up a remote connection.
     
     Enable the **Connect using remote connection server** option and select the server to be used for the connection under **Job server**.

4. Click **Next** on the start page of system connection wizard.

5. Select the database system to which you want to connect on the **Select database system** page.

6. Enter the connection data for the database containing the Universal Cloud Interface Module on the **Connection parameter** page.

**Table 8: SQL Server database connection data**

<table>
<thead>
<tr>
<th>Data</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server</td>
<td>Database server.</td>
</tr>
<tr>
<td>Windows authentication</td>
<td>Specifies whether integrated Windows authentication is used. This type of authentication is not recommended. If you decide to use it anyway, ensure that your environment supports Windows authentication.</td>
</tr>
<tr>
<td>User</td>
<td>SQL Server Login name.</td>
</tr>
<tr>
<td>Password</td>
<td>SQL Server login password.</td>
</tr>
<tr>
<td>Database</td>
<td>Database.</td>
</tr>
</tbody>
</table>
To enter additional information about the database connection, click **Advanced options**.

Click **Test** to test whether the database is accessible.

7. Enter the private key for encrypting the database on the **Encryption** page.

8. You can save the connection data on the last page of the system connection wizard.
   - Set the **Save connection locally** option to save the connection data. This can be reused when you set up other synchronization projects.
   - Click **Finish**, to end the system connection wizard and return to the project wizard.

9. On the **One Identity Manager Connection** tab, test the data for connecting to the One Identity Manager database. The data is loaded from the connected database. Reenter the password.

   **NOTE:** If you use an unencrypted One Identity Manager database and have not yet saved any synchronization projects to the database, you need to enter all connection data again. This page is not shown if a synchronization project already exists.

10. The wizard loads the target system schema. This may take a few minutes depending on the type of target system access and the size of the target system.

11. Select the cloud application to synchronize on the **Select cloud application** page.

12. On the **Restrict target system access** page, you specify how system access should work. You have the following options:

    **Table 9: Specify target system access**

<pre><code>| Option                                 | Meaning                                                                                                                                                                                                 |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Read-only access to target system.     | Specifies whether a synchronization workflow is only to be set up for the initial loading of the target system into the One Identity Manager database. The synchronization workflow has the following characteristics: |
|                                        | - Synchronization is in the direction of **One Identity Manager**.                                                                                                                                       |
|                                        | - Processing methods in the synchronization steps are only defined for synchronization in the direction of **One Identity Manager**.                                                          |
| Read/write access to target system.    | Specifies whether a provisioning workflow is to be set up in addition to the synchronization workflow for the initial loading of the target system.                                                        |
| Provisioning available.                | The provisioning workflow displays the following                                                                                                                                                     |
</code></pre>
<table>
<thead>
<tr>

<td>• Synchronization steps are only created for such schema classes whose schema types have write access.</td>
</tr>
</tbody>
</table>

13. Select the synchronization server to execute synchronization on the **Synchronization server** page.  
If the synchronization server is not declared as a Job server in the One Identity Manager database yet, you can add a new Job server.  
a. Click to add a new Job server.  
b. Enter a name for the Job server and the full server name conforming to DNS syntax.  
c. Click **OK**.  
The synchronization server is declared as Job server for the target system in the One Identity Manager database.  

| NOTE: After you save the synchronization project, ensure that this server is set up as a synchronization server. |

14. To close the project wizard, click **Finish**.  
Two start up configurations and two default schedules are created for regular synchronization.  

**Table 10: Start up configuration**  

<table>
<thead>
<tr>
<th>Start up configuration</th>
<th>Execution interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronization of the cloud application</td>
<td>Daily</td>
</tr>
<tr>
<td>Synchronization of pending changes</td>
<td>Hourly</td>
</tr>
</tbody>
</table>

The synchronization project is created, saved and enabled immediately.  

| NOTE: If you do not want the synchronization project to be activated immediately, disable the **Activate and save the new synchronization project automatically** option. In this case, save the synchronization project manually before closing the Synchronization Editor. |

| NOTE: The connection data for the target system is saved in a variable set and can be modified under **Configuration | Variables** in Synchronization Editor. |
To configure the content of the synchronization log

1. Open the synchronization project in the Synchronization Editor.
2. To configure the synchronization log for target system connection, select the category Configuration | Target system.
3. To configure the synchronization log for the database connection, select Configuration | One Identity Manager connection.
4. Select the General view and click Configure.
5. Select the Synchronization log view and set Create synchronization log.
6. Enable the data to be logged.

   **NOTE:** Some content generates a particularly large volume of log data. The synchronization log should only contain data required for troubleshooting and other analyses.
7. Click OK.

To synchronize on a regular basis

1. Open the synchronization project in the Synchronization Editor.
2. Select the category Configuration | Start up configurations.
3. Select a start up configuration in the document view and click Edit schedule.
4. Edit the schedule properties.
5. To enable the schedule, click Activate.
6. Click OK.

To start initial synchronization manually

1. Open the synchronization project in the Synchronization Editor.
2. Select the category Configuration | Start up configurations.
3. Select a start up configuration in the document view and click Execute.
4. Confirm the security prompt with Yes.
NOTE:

Following a synchronization, employees are automatically created for the user accounts in the default installation. If an account definition for the target system is not yet known at the time of synchronization, user accounts are linked with employees. However, account definitions are not assigned. The user accounts are therefore in a **Linked** state.

To manage the user accounts using account definitions, assign an account definition and a manage level to these user accounts.

**To select user accounts through account definitions**

1. Create an account definition.
2. Assign an account definition to the target system.
3. Assign the account definition and manage level to user accounts in **linked** status.
   a. In Manager, select **Cloud target systems** | `<Target system>` | **User accounts** | **Linked but not configured** | `<Target system>`.
   b. Select **Assign account definition to linked accounts**.

**Start-up configurations**

The project wizard adds two start-up configurations that run cloud application synchronization.
Synchronization of the cloud application
The objects of the cloud application, such as user accounts, groups and group memberships are synchronized. The workflow "Initial synchronization" is used. Synchronization is run on a daily basis with the default schedule.

Synchronization of pending changes
If cloud objects are changed in the Cloud Systems Management Module, these changes must first be transferred to the Universal Cloud Interface Module and can then be provisioned to the cloud application itself. To track whether the changes have been successfully provisioned in the cloud application, they are labeled with "Pending changes". The details, time of creation, and processing status of every pending change are saved. Once provisioning is complete, the processing status must be transferred from the Universal Cloud Interface to the Cloud Systems Management Module. To do this, run the start up configuration "Synchronization of pending changes". This uses the workflow "Initial synchronization". Synchronization is run on an hourly basis with the default schedule.

Related topics
- Provisioning object changes on page 122

Displaying synchronization results
Synchronization results are summarized in the synchronization log. You can specify the extent of the synchronization log for each system connection individually. One Identity Manager provides several reports in which the synchronization results are organized under different criteria.

To display a synchronization log
1. Open the synchronization project in the Synchronization Editor.
2. Select Logs.
3. Click ▶ in the navigation view toolbar.
   Logs for all completed synchronization runs are displayed in the navigation view.
4. Select a log by double-clicking on it.
   An analysis of the synchronization is shown as a report. You can save the report.

To display a provisioning log
1. Open the synchronization project in the Synchronization Editor.
2. Select Logs.
3. Click ⌡ in the navigation view toolbar.
   Logs for all completed provisioning processes are displayed in the navigation view.
4. Select a log by double-clicking on it.
   
   An analysis of the provisioning is show as a report. You can save the report.

The log is marked in color in the navigation view. This mark shows you the execution status of the synchronization/provisioning.

Synchronization logs are stored for a fixed length of time.

To modify the retention period for synchronization logs

- In Designer, enable the DPR | Journal | LifeTime configuration parameter and enter the maximum retention period.

Customizing synchronization configuration

You have used the Synchronization Editor to set up a synchronization project for initial synchronization with Universal Cloud Interface. You can use this synchronization project to load cloud application objects into the Cloud Systems Management Module. If you manage user accounts and their authorizations with One Identity Manager, changes are provisioned in the Universal Cloud Interface environment.

You must customize the synchronization configuration in order to regularly compare the cloud application and to synchronize changes.

- To use the Cloud Systems Management Module as master system during synchronization, create a workflow with synchronization in the direction of the "Target system".
- To specify which target system objects and database object are included in synchronization, edit the scope of the target system connection and the One Identity Manager database connection. To prevent data inconsistencies, define the same scope in both systems. If no scope is defined, all objects will be synchronized.
- You can use variables to create generally applicable synchronization configurations that contain the necessary information about the synchronization objects when synchronization starts. Variables can be implemented in base objects, schema classes, or processing methods, for example.
- Use variables to set up a synchronization project which can be used for several different cloud applications. Store the connection parameter as a variable for logging in to the databases.
- Update the schema in the synchronization project if the One Identity Manager schema or target system schema has changed. Then you can add the changes to the mapping.
**IMPORTANT:** As long as synchronization is running, you must not start another synchronization for the same target system. This applies especially, if the same synchronization objects would be processed.

- If another synchronization is started with the same start up configuration, this process is stopped and is assigned the **Frozen** execution status. An error message is written to the One Identity Manager Service log file.
- If another synchronization is started with another start up configuration, that addresses the same target system, it may lead to synchronization error or loss of data. Specify One Identity Manager behavior in this case, in the start up configuration.
  - Use the schedule to ensure that the start up configurations are executed in sequence.
  - Group start up configurations with the same start up behavior.

For detailed information about configuring synchronization, see the One Identity Manager Target System Synchronization Reference Guide.

**Detailed information about this topic**

- How to configure Universal Cloud Interface synchronization on page 25
- Configuring synchronization of multiple cloud applications on page 26
- Updating schemas on page 26

## How to configure Universal Cloud Interface synchronization

The synchronization project for initial synchronization provides a workflow for initial loading of target system objects (initial synchronization) and one for provisioning object modifications from the One Identity Manager database to the target system (provisioning). To use One Identity Manager as the master system during synchronization, you also require a workflow with synchronization in the direction of the **Target system**.

**To create a synchronization configuration for synchronizing Universal Cloud Interface**

1. Open the synchronization project in the Synchronization Editor.
2. Check whether existing mappings can be used for synchronizing the target system. Create new maps if required.
3. Create a new workflow with the workflow wizard.
   - Creates a workflow with **Target system** as its synchronization direction.
4. Create a new start up configuration. Use the new workflow to do this.
5. Save the changes.
6. Run a consistency check.

Related topics
- Configuring synchronization of multiple cloud applications on page 26

Configuring synchronization of multiple cloud applications

Prerequisites
- All virtual schema properties used in the mapping must exist in the extended schema of both cloud applications.

To customize a synchronization project for synchronizing another cloud application
1. Open the synchronization project in the Synchronization Editor.
2. Create a new base object for the other cloud application. Use the wizards to attach a base object.
   - In the wizard, select the Universal Cloud Interface connector and declare the connection parameters. The connection parameters are saved in a special variable set.
     A start up configuration is created, which uses the newly created variable set.
3. Change other elements of the synchronization configuration as required.
4. Save the changes.
5. Run a consistency check.

Related topics
- How to configure Universal Cloud Interface synchronization on page 25

Updating schemas

All the schema data (schema types and schema properties) of the target system schema and the One Identity Manager schema are available when you are editing a synchronization project. Only a part of this data is really needed for configuring synchronization. If a synchronization project is finished, the schema is compressed to remove unnecessary data from the synchronization project. This can speed up loading the synchronization project. Deleted schema data can be added to the synchronization configuration again at a later point.
If the target system schema or the One Identity Manager schema has changed, these changes must also be added to the synchronization configuration. Then the changes can be added to the schema property mapping.

To include schema data that have been deleted through compressing and schema modifications in the synchronization project, update each schema in the synchronization project. This may be necessary if:

- A schema was changed by:
  - Changes to a target system schema
  - Customizations to the One Identity Manager schema
  - A One Identity Manager update migration
- A schema in the synchronization project was shrunk by:
  - enabling the synchronization project
  - saving the synchronization project for the first time
  - compressing a schema

**To update a system connection schema**

1. Open the synchronization project in the Synchronization Editor.
2. Select **Configuration | Target system**.
   - OR -
   3. Select **Configuration | One Identity Manager Connection**.
3. Select the view **General** and click **Update schema**.
4. Confirm the security prompt with **Yes**.
   This reloads the schema data.

**To edit a mapping**

1. Open the synchronization project in the Synchronization Editor.
2. Select the category **Mappings**.
3. Select a mapping in the navigation view.
   Opens the Mapping Editor. For more detailed information about mappings, see the **One Identity Manager Target System Synchronization Reference Guide**.

**NOTE:** The synchronization is deactivated if the schema of an activated synchronization project is updated. Reactivate the synchronization project to synchronize.
Speeding up synchronization with revision filtering

When you start synchronization, all synchronization objects are loaded. Some of these objects have not been modified since the last synchronization and, therefore, must not be processed. Synchronization is accelerated by only loading those object pairs that have changed since the last synchronization. One Identity Manager uses revision filtering to accelerate synchronization.

One Identity Manager supports revision filtering. The date of the last target system object change (column XDateUpdated) is used as revision counter. Each synchronization saves its last execution date as a revision in the the One Identity Manager database (table DPRRevisionStore, column Value). This value is used as a comparison for revision filtering when the same workflow is synchronized the next time. When this workflow is synchronized the next time, the target system objects' change date is compared with the revision saved in the One Identity Manager database. Only those objects that have been changed since this date are loaded from the target system.

The revision is found at start of synchronization. Objects changed after this point are included with the next synchronization.

Revision filtering can be applied to workflows and start up configuration.

**To permit revision filtering on a workflow**
- Open the synchronization project in the Synchronization Editor.
- Edit the workflow properties. Select the entry *Use revision filter* from Revision filtering.

**To permit revision filtering for a start up configuration**
- Open the synchronization project in the Synchronization Editor.
- Edit the start up configuration properties. Select the entry *Use revision filter* from Revision filtering.

For more detailed information about revision filtering, see the One Identity Manager Target System Synchronization Reference Guide.

Post-processing outstanding objects

Objects, which do not exist in the target system, can be marked as outstanding in One Identity Manager by synchronizing. This prevents objects being deleted because of an incorrect data situation or an incorrect synchronization configuration.

Outstanding objects
- Cannot be edited in One Identity Manager.
- Are ignored by subsequent synchronization.
- Are ignored by inheritance calculations.

This means, all memberships and assignments remain intact until the outstanding objects have been processed.

Start target system synchronization to do this.

**To post-process outstanding objects**

1. In Manager, select **Cloud target systems | Target system synchronization: Universal Cloud Interface**.

   All tables assigned to the target system type **Universal Cloud Interface** as synchronization tables are displayed in the navigation view.

2. On the **Target system synchronization** form, in the **Table / object** column, open the node of the table for which you want to post-process outstanding objects.

   All objects that are marked as outstanding are shown. The **Last log entry** and **Last method run** columns display the time at which the last entry was made in the synchronization log and which processing method was executed. The **No log available** entry can mean the following:

   - The synchronization log has already been deleted.
   - OR -
   - An assignment from a member list has been deleted in the target system.

     The base object of the assignment has been updated during the synchronization. A corresponding entry appears in the synchronization log. The entry in the assignment table is marked as outstanding, but there is no entry in the synchronization log.

   - An object that contains a member list has been deleted in the target system.

     During synchronization, the object and all corresponding entries in assignment tables are marked as outstanding. However, an entry in the synchronization log appears only for the deleted object.

   **TIP:**

   **To display object properties of an outstanding object**

   a. Select the object on the target system synchronization form.
   b. Open the context menu and click **Show object**.

3. Select the objects you want to rework. Multi-select is possible.

4. Click one of the following icons in the form toolbar to execute the respective method.
Table 11: Methods for handling outstanding objects

<table>
<thead>
<tr>
<th>Icon</th>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Icon" /></td>
<td>Delete</td>
<td>The object is immediately deleted in the One Identity Manager database. Deferred deletion is not taken into account. The <strong>Outstanding</strong> label is removed for the object. Indirect memberships cannot be deleted.</td>
</tr>
</tbody>
</table>
| ![Icon](image) | Publish | The object is added in the target system. The **Outstanding** label is removed for the object. The method triggers the HandleOutstanding event. This runs a target system specific process that triggers the provisioning process for the object. Prerequisites:  
  - The table containing the object can be published.  
  - The target system connector has write access to the target system. |
| ![Icon](image) | Reset | The **Outstanding** label is removed for the object. |

5. Confirm the security prompt with **Yes**.

NOTE: By default, the selected objects are processed in parallel, which speeds up execution of the selected method. If an error occurs during processing, the action is stopped and all changes are discarded.

Bulk processing of objects must be disabled if errors are to be localized, which means the objects are processed sequentially. Failed objects are named in the error message. All changes that were made up until the error occurred are saved.

**To disable bulk processing**

- Deactivate ![Icon](image) in the form toolbar.

NOTE: The target system connector must have write access to the target system in order to publish outstanding objects that are being post-processed. That means, the option **Connection is read only** must no be set for the target system connection.

The target system type determines which tables are going to be synchronized. You cannot synchronize custom table in the Cloud Systems Management Module. This means you cannot configure target system configuration for custom tables.

**To display the target system synchronization configuration**

1. Select **Cloud Target Systems | Basic configuration data | Target system types**.
2. Select Universal Cloud Interface in the result list.
3. Select **Assign synchronization tables** in the task view.
   All the tables that could be synchronized are enabled.
4. Select **Configure tables for publishing**.
   **Can be published** is set for all table with outstanding objects in the target system.

**Help for the analysis of synchronization issues**

You can generate a report for analyzing problems which occur during synchronization, for example, insufficient performance. The report contains information such as:

- Consistency check results
- Revision filter settings
- Scope applied
- Analysis of the synchronization buffer
- Object access times in the One Identity Manager database and in the target system

**To generate a synchronization analysis report**

1. Open the synchronization project in the Synchronization Editor.
2. Select the menu **Help | Generate synchronization analysis report** and answer the security prompt with **Yes**.
   The report may take a few minutes to generate. It is displayed in a separate window.
3. Print the report or save it in one of the available output formats.

**Deactivating synchronization**

Regular synchronization cannot be started until the synchronization project and the schedule are active.

**To prevent regular synchronization**

1. Open the synchronization project in the Synchronization Editor.
2. Select the start up configuration and deactivate the configured schedule.
   Now you can only start synchronization manually.

An activated synchronization project can only be edited to a limited extend. The schema in the synchronization project must be updated if schema modifications are required. The synchronization project is deactivated in this case and can be edited again.
Furthermore, the synchronization project must be deactivated if synchronization should not be started by any means (not even manually).

**To deactivate the synchronization project**

1. Open the synchronization project in the Synchronization Editor.
2. Select General on the start page.
3. Click Deactivate project.

**Detailed information about this topic**

- Creating a synchronization project for initial synchronization of a cloud application on page 16
Basic data for managing a Universal Cloud Interface environment

The following data is relevant for managing cloud application in the Cloud Systems Management Module.

- Configuration parameters
  Use configuration parameters to configure the behavior of the system's basic settings. One Identity Manager provides default settings for different configuration parameters. Check the configuration parameters and modify them as necessary to suit your requirements.
  
  Configuration parameters are defined in the One Identity Manager modules. Each One Identity Manager module can also install configuration parameters. You can find an overview of all configuration parameters in **Base data | General | Configuration parameters** in Designer.
  
  For more information, see Appendix: Configuration parameters for managing cloud target systems on page 128.

- Target system types
  Target system types are required for configuring target system comparisons. Tables containing outstanding objects are maintained on target system types.
  
  For more information, see Post-processing outstanding objects on page 28.

- Account definitions
  One Identity Manager has account definitions for automatically allocating user accounts to employees during working hours. You can create account definitions for every target system. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee.
  
  For more information, see Setting up account definitions on page 34.

- Password policies
  One Identity Manager provides you with support for creating complex password policies, for example, for system user passwords, the employees' central password
as well as passwords for individual target systems. Password policies apply not only when the user enters a password but also when random passwords are generated.

Predefined password policies are supplied with the default installation that you can user or customize if required. You can also define your own password policies.

For more information, see Password policies for user accounts on page 53.

• Initial password for new user accounts

You have the different options for issuing an initial password for user accounts. The central password of the assigned employee can be aligned with the user account password, a predefined, fixed password can be used or a randomly generated initial password can be issued.

For more information, see Initial password for new user accounts on page 63.

• Email notifications about login data

When a new user account is created, the login data are send to a specified recipient. In this case, two messages are sent with the user name and the initial password. Mail templates are used to generate the messages.

For more information, see Email notifications about login data on page 65.

• Target system managers

A default application role exists for the target system manager in One Identity Manager. Assign the employees who are authorized to edit all cloud target system in One Identity Manager to this application role.

ns for target system managers to individual farms. SharePoint Define additional application roles if you want to limit the edit permissions for target system managers to individual cloud target systems. The application roles must be added under the default application role.

For more information, see Target system managers on page 66.

• Server

Servers must be aware of your server functionality in order to handle target-system-specific processes in One Identity Manager. For example, the synchronization server.

For more information, see Editing a server on page 68.

Setting up account definitions

One Identity Manager has account definitions for automatically allocating user accounts to employees during working hours. You can create account definitions for every target system. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee.

The data for the user accounts in the respective target system comes from the basic employee data. The employee must own a central user account. The assignment of the IT operating data to the employee’s user account is controlled through the primary assignment of the employee to a location, a department, a cost center, or a business role
(template processing). Processing is done through templates. There are predefined templates for determining the data required for user accounts included in the default installation. You can customize templates as required.

For detailed information about account definitions, see the One Identity Manager Target System Base Module Administration Guide.

The following steps are required to implement an account definition:

- Creating an account definition
- Setting up manage levels
- Creating a mapping rule for IT operating data
- Determining IT operating data
- Assigning account definitions to employees
- Assigning account definitions to a cloud target system

Creating an account definition

To create a new account definition

1. In Manager, select the category Cloud Target Systems | Basic configuration data | Account definitions | Account definitions.
2. Select an account definition in the result list. Select Change master data.
   -OR-
   Click in the result list.
3. Enter the account definition's master data.
4. Save the changes.

Detailed information about this topic

- Master data for an account definition on page 35

Master data for an account definition

Enter the following data for an account definition:

Table 12: Master data for an account definition

**Setting up manage levels**

Specify the manage level for an account definition for managing user accounts. The user account’s manage level specifies the extent of the employee’s properties that are inherited by the user account. This allows an employee to have several user accounts in one target system, for example:
Default user account that inherits all properties from the employee

Administrative user account that is associated to an employee but should not inherit the properties from the employee.

One Identity Manager supplies a default configuration for manage levels:

- **Unmanaged**: User accounts with the Unmanaged manage level are linked to the employee but they do no inherit any further properties. When a new user account is added with this manage level and an employee is assigned, some of the employee’s properties are transferred initially. If the employee properties are changed at a later date, the changes are not passed onto the user account.

- **Full managed**: User accounts with the Full managed manage level inherit defined properties of the assigned assigned employee. When a new user account is created with this manage level and an employee is assigned, the employee’s properties are transferred in an initial state. If the employee properties are changed at a later date, the changes are passed onto the user account.

**NOTE**: The Full managed and Unmanaged are analyzed in templates. You can customize the supplied templates in the Designer. You can define other manage levels depending on your requirements. You need to amend the templates to include manage level approaches.

Specify the effect of temporarily or permanently disabling, deleting or the security risk of an employee on its user accounts and group memberships for each manage level. For detailed information about manage levels, see the One Identity Manager Target System Base Module Administration Guide.

- Employee user accounts can be locked when they are disabled, deleted or rated as a security risk so that permissions are immediately withdrawn. If the employee is reinstated at a later date, the user accounts are also reactivated.

- You can also define group membership inheritance. Inheritance can be discontinued if desired when, for example, the employee’s user accounts are disabled and therefore cannot be members in groups. During this time, no inheritance processes should be calculated for this employee. Existing group memberships are deleted!

**To assign manage levels to an account definition**

1. In Manager, select the category Cloud Target Systems | Basic configuration data | Account definitions | Account definitions.
2. Select an account definition in the result list.
3. Select Assign manage level.
4. Assign the manage levels in Add assignments.
   - OR -
   Delete the manage levels in Remove assignments.
5. Save the changes.

**IMPORTANT**: The Unmanaged manage level is assigned automatically when you create an account definition and it cannot be removed.
To edit a manage level

1. Select Cloud Target Systems | Basic configuration data | Account definitions | Manage levels.
2. Select the manage level in the result list. Select Change master data.
   -OR-
   Click in the result list.
3. Edit the manage level’s master data.
4. Save the changes.

### Creating a mapping rule for IT operating data

An account definition specifies which rules are used to form the IT operating data and which default values will be used if no IT operating data can be found through the employee’s primary roles.

- Container (per target system)
- Groups can be inherited
- Identity
- Privileged user account

**To create a mapping rule for IT operating data**

1. In Manager, select the category [Cloud Target Systems | Basic configuration data | Account definitions | Account definitions](#).
2. Select an account definition in the result list.
3. Select **Edit IT operating data mapping** and enter the following data.

**Table 14: Mapping rule for IT operating data**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>

- Determining IT operating data on page 42
Determining IT operating data

To create user accounts with the Full managed manage level, the required IT operating data must be determined. The operating data required to automatically supply an employee with IT resources is shown in the business roles, departments, locations or cost centers. An employee is assigned a primary business role, primary location, primary department or primary cost center. The necessary IT operating data is ascertained from these assignments and used in creating the user accounts. Default values are used if valid IT operating data cannot be found over the primary roles.

You can also specify IT operating data directly for a specific account definition.

Example

Normally, each employee in department A obtains a default user account in the cloud target system A. In addition, certain employees in department A obtain administrative user accounts in the cloud target system A.

Create an account definition A for the default user account of the cloud target system A and an account definition B for the administrative user account of cloud target system A. Specify the property "Department" in the IT operating data formatting rule for the account definitions A and B in order to determine the valid IT operating data.

Specify the effective IT operating data of department A for the cloud target system A. This IT operating data is used for standard user accounts. In addition, specify the effective account definition B IT operating data for department A. This IT operating data is used for administrative user accounts.

To define IT operating data

1. In Manager, select the role in the Organizations or Business roles category.
2. Select the Edit IT operating data task.
3. Click **Add** and enter the following data.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effects on</td>
<td>IT operating data application scope. The IT operating data can be used for a target system or a defined account definition. To specify an application scope</td>
</tr>
<tr>
<td></td>
<td>a. Click ➔ next to the text box.</td>
</tr>
<tr>
<td></td>
<td>b. Under <strong>Table</strong>, select the table that maps the target system for select the <strong>TSBAccountDef</strong> table for an account definition.</td>
</tr>
<tr>
<td></td>
<td>c. Select the specific target system or account definition under <strong>Effects on</strong>.</td>
</tr>
<tr>
<td></td>
<td>d. Click <strong>OK</strong>.</td>
</tr>
<tr>
<td>Column</td>
<td>User account property for which the value is set.</td>
</tr>
<tr>
<td></td>
<td>In the menu, you can select the columns that use the <strong>TSB_ITDataFromOrg</strong> script in their template. For detailed information, see the <em>One Identity Manager Target System Base Module Administration Guide</em>.</td>
</tr>
<tr>
<td>Value</td>
<td>Concrete value which is assigned to the user account property.</td>
</tr>
</tbody>
</table>

4. Save the changes.

**Related topics**

- Creating a mapping rule for IT operating data on page 40

**Modify IT operating data**

If IT operating data changes, you must transfer these changes to the existing user accounts. To do this, templates must be rerun on the affected columns. Before you can run the templates, you can check what effect a change to the IT operating data has on the existing user accounts. You can decide whether the change is transferred to the One Identity Manager database in the case of each affected column in each affected database.

**Prerequisites**

- The IT operating data of a department, cost center, business role, or a location was changed.
  - OR -
- The default values in the IT operating data template were modified for an account definition.
NOTE: If the assignment of an employee to a primary department, cost center, business role or to a primary location changes, the templates are automatically executed.

To execute the template

1. In Manager, select the category Cloud Target Systems | Basic configuration data | Account definitions | Account definitions.
2. Select an account definition in the result list.
3. Select Execute templates in the task view
   
   This displays a list of all user account, which are created through the selected account definition and whose properties are changed by modifying the IT operating data.

   Old value: Current value of the object property.
   
   New value: Value that the object property would have following modification of the IT operating data.
   
   Selection: Specifies whether the modification shall be adopted for the user account.

4. Mark all the object properties in the selection column that will be given the new value.
5. Click Apply.

   The templates are applied to all selected user accounts and properties.

Assigning account definitions to employees

Account definitions are assigned to company employees.

Indirect assignment is the default method for assigning account definitions to employees. Account definitions are assigned to departments, cost centers, locations or roles. The employees are categorized into these departments, cost centers, locations or roles depending on their function in the company and thus obtain their account definitions. To react quickly to special requests, you can assign individual account definitions directly to employees.

You can automatically assign special account definitions to all company employees. It is possible to assign account definitions to the IT Shop as requestable products. A department manager can then request user accounts from the Web Portal for his staff. It is also possible to add account definitions to system roles. These system roles can be assigned to employees through hierarchical roles or directly or added as products in the IT Shop.

In the One Identity Manager default installation, the processes are checked at the start to see if the employee already has a user account in the target system that has an account
definition. If no user account exists, a new user account is created with the account definition’s default manage level.

NOTE: If a user account already exists and is disabled, then it is re-enabled. You have to alter the user account manage level afterwards in this case.

Prerequisites for indirect assignment of account definitions to employees

- Assignment of employees and account definitions is permitted for role classes (department, cost center, location or business role).

NOTE: As long as an account definition for an employee is valid, the employee retains the user account that was created by it. If the assignment of an account definition is removed, the user account that was created from this account definition is deleted.

For detailed information about preparing role classes to be assigned, see the One Identity Manager Identity Management Base Module Administration Guide.

Assigning account definitions to all employees

To assign an account definition to all employees

1. In Manager, select the category **Cloud Target Systems | Basic configuration data | Account definitions | Account definitions**.

2. Select an account definition in the result list.

3. Select **Change master data**.

4. Set **Automatic assignment to employees** on **General**.

   **IMPORTANT:** Only set this option if you can ensure that all current internal employees in the database and all pending newly added internal employees obtain a user account in this target system.

5. Save the changes.

The account definition is assigned to every employee that is not marked as external. New employees automatically obtain this account definition as soon as they are added. The assignment is calculated by the DBQueue Processor.

**NOTE:** Disable **Automatic assignment to employees** to remove automatic assignment of the account definition to all employees. The account definition cannot be reassigned to employees from this point on. Existing assignments remain intact.

Adding account definitions in the IT Shop on page 49

Adding account definitions in the IT Shop

A account definition can be requested by shop customers when it is assigned to an IT Shop shelf. To ensure it can be requested, further prerequisites need to be guaranteed.

- The account definition must be labeled with the IT Shop option.
- The account definition must be assigned to a service item.

**TIP:** In Web Portal, all products that can be requested are grouped together by service category. To make the account definition easier to find in Web Portal, assign a service category to the service item.

- If the account definition is only assigned to employees using IT Shop assignments, you must also set Only for use in IT Shop. Direct assignment to hierarchical roles may not be possible.

**NOTE:** IT Shop administrators can assign account definitions to IT Shop shelves if login is role-based. Target system administrators are not authorized to add account definitions in the IT Shop.

**To add an account definition to the IT Shop**

1. In Manager, select Cloud target systems | Basic configuration data | Account definitions | Account definitions (non-role-based login).
   - OR -
   In Manager, select Entitlements | Account definitions (role-based login).
2. Select an account definition in the result list.
3. Select Add to IT Shop.
4. Assign the account definitions to the IT Shop shelves in Add assignments.
5. Save the changes.

**To remove an account definition from individual IT Shop shelves**

1. In Manager, select Cloud target systems | Basic configuration data | Account definitions | Account definitions (non-role-based login).
   - OR -
   In Manager, select Entitlements | Account definitions (role-based login).
2. Select an account definition in the result list.
3. Select Add to IT Shop.
4. Remove the account definitions from the IT Shop shelves in **Remove assignments**.
5. Save the changes.

**To remove an account definition from all IT Shop shelves**

1. In Manager, select **Cloud target systems** | **Basic configuration data** | **Account definitions** | **Account definitions** (non-role-based login).
   - OR -
   In Manager, select **Entitlements** | **Account definitions** (role-based login).
2. Select an account definition in the result list.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.
   The account definition is removed from all shelves by One Identity Manager Service. All requests and assignment requests with this account definition are canceled in the process.

For more detailed information about request from company resources through the IT Shop, see the *One Identity Manager IT Shop Administration Guide*.

- Assigning account definitions to system roles on page 48

**Assigning account definitions to a cloud target system**

The following prerequisites must be fulfilled if you implement automatic assignment of user accounts and employees resulting in administered user accounts (state **Linked configured**):

- The account definition is assigned to the target system.
- The account definition has the default manage level.

User accounts are only linked to the employee (**Linked**) if no account definition is given. This is the case on initial synchronization, for example.
To assign the account definition to a target system

1. In Manager, select the target system in Cloud target systems.
2. Select Change master data.
3. Select the account definition for user accounts from Account definition (initial).
4. Save the changes.

You must customize automatic assignment of employees to user accounts for custom target systems.

Detailed information about this topic

- Automatic assignment of employees to user accounts on page 94

Deleting an account definition

You can delete account definitions if they are not assigned to target systems, employees, hierarchical roles or any other account definitions.

To delete an account definition

1. Remove automatic assignments of the account definition from all employees.
   a. In Manager, select the category Cloud Target Systems | Basic configuration data | Account definitions | Account definitions.
   b. Select an account definition in the result list.
   c. Select Change master data.
   d. Disable Automatic assignment to employees on the General tab.
   e. Save the changes.
2. Remove direct assignments of the account definition to employees.
   a. In Manager, select the category Cloud Target Systems | Basic configuration data | Account definitions | Account definitions.
   b. Select an account definition in the result list.
   c. Select Assign to employees in the task view.
   d. Remove employees from Remove assignments.
   e. Save the changes.
3. Remove the account definition’s assignments to departments, cost centers and locations.
   a. In Manager, select the category Cloud Target Systems | Basic configuration data | Account definitions | Account definitions.
   b. Select an account definition in the result list.
   c. Select Assign organizations.
d. In **Remove assignments**, remove the relevant departments, cost centers, and locations.

e. Save the changes.

4. Remove the account definition's assignments to business roles.
   a. In Manager, select the category **Cloud Target Systems** | **Basic configuration data** | **Account definitions** | **Account definitions**.
   b. Select an account definition in the result list.
   c. Select **Assign business roles**.
      Remove the business roles in **Remove assignments**.
   d. Save the changes.

5. If the account definition was requested through the IT Shop, it must be canceled and removed from all IT Shop shelves.
   For more detailed information about unsubscribing requests, see the **One Identity Manager Web Portal User Guide**.

   **To remove an account definition from all IT Shop shelves**
   a. In Manager, select **Cloud target systems** | **Basic configuration data** | **Account definitions** | **Account definitions** (non-role-based login).
      - OR -
      In Manager, select **Entitlements** | **Account definitions** (role-based login).
   b. Select an account definition in the result list.
   c. Select **Remove from all shelves (IT Shop)**.
   d. Confirm the security prompt with **Yes**.
   e. Click **OK**.
      The account definition is removed from all shelves by One Identity Manager Service. All requests and assignment requests with this account definition are canceled in the process.

6. Remove the account definition assignment as required account definition for another account definition. As long as the account definition is required for another account definition, it cannot be deleted. Check all the account definitions.
   a. In Manager, select the category **Cloud Target Systems** | **Basic configuration data** | **Account definitions** | **Account definitions**.
   b. Select an account definition in the result list.
   c. Select **Change master data**.
   d. Remove the account definition in the **Required account definition** menu.
   e. Save the changes.
7. Remove the account definition's assignments to target systems.
   a. In Manager, select the target system in **Cloud target systems**.
   b. Select **Change master data**.
   c. Remove the assigned account definitions on the **General** tab.
   d. Save the changes.
8. Delete the account definition.
   a. In Manager, select the category **Cloud Target Systems | Basic configuration data | Account definitions | Account definitions**.
   b. Select an account definition in the result list.
   c. Click **a** to delete an account definition.

**Password policies for user accounts**

One Identity Manager provides you with support for creating complex password policies, for example, for system user passwords, the employees' central password as well as passwords for individual target systems. Password polices apply not only when the user enters a password but also when random passwords are generated.

Predefined password policies are supplied with the default installation that you can use or customize if required. You can also define your own password policies.

**Detailed information about this topic**

- Predefined password policies on page 53
- Using a password policy on page 55
- Editing password policies on page 57
- Custom scripts for password requirements on page 60
- Excluded list for passwords on page 62
- Checking a password on page 63
- Testing generation of a password on page 63

**Predefined password policies**

You can customize predefined password policies to meet your own requirements, if necessary.
Password for logging in to One Identity Manager

The One Identity Manager password policy is applied for logging in to One Identity Manager. This password policy defined the settings for the system user passwords (DialogUser.Password and Person.DialogUserPassword) as well as the access code for a one off log in on the Web Portal (Person.Passcode).

- **NOTE:** The One Identity Manager password policy is marked as the default policy. This password policy is applied if no other password policy can be found for employees, user accounts or system users.

For detailed information about password policies for employees, see the One Identity Manager Identity Management Base Module Administration Guide.

Password policy for forming employees' central passwords

An employee's central password is formed from the target system specific user accounts by respective configuration. The Employee central password policy password policy defines the settings for the (Person.CentralPassword) central password. Members of the Identity Management | Employees | Administrators application role can adjust this password policy.

- **IMPORTANT:** Ensure that the Employee central password policy password policy does not violate the system-specific requirements for passwords.

For detailed information about password policies for employees, see the One Identity Manager Identity Management Base Module Administration Guide.

Password policies for user accounts

Predefined password policies are provided, which you can apply to the user account password columns of the user accounts.

- **IMPORTANT:** If you do not use password policies that are specific to the target system, the One Identity Manager password policy standard policy applies. in this case, ensure that the default policy does not violate the target systems requirements.

- **NOTE:** When you update One Identity Manager version 7.x to One Identity Manager version 8.1.1, the configuration parameter settings for forming passwords are passed on to the target system specific password policies.

The Cloud system password policy is predefined for cloud target systems. You can apply this password policy to cloud target system user account passwords (CSMUser.Password) or to a container.

If the cloud target systems' or containers' password requirements differ, it is recommended that you set up your own password policies for each cloud target system or container.

Furthermore, you can apply password policies based on the account definition of the user accounts or based on the manage level of the user accounts.
Using a password policy

The **Cloud system password policy** is predefined for cloud target systems. You can apply this password policy to cloud target system user account passwords (CSMUser.Password) or to a container.

If the cloud target systems' or containers' password requirements differ, it is recommended that you set up your own password policies for each cloud target system or container.

Furthermore, you can apply password policies based on the account definition of the user accounts or based on the manage level of the user accounts.

The password policy that is to be used for a user account is determined in the following sequence:

1. Password policy of the account definition of the user account
2. Password policy of the manage level of the user account
3. Password policy for the container of the user account
4. Password policy for the target system of the user account
5. Password policy **One Identity Manager password policy** (default policy)

**IMPORTANT:** If you do not use password policies that are specific to the target system, the **One Identity Manager password policy** standard policy applies. In this case, ensure that the default policy does not violate the target systems requirements.

**To reassign a password policy**

1. In the Manager, select the **Cloud target systems | Basic configuration data | Password policies** category.
2. Select the password policy in the result list.
3. Select **Assign objects**.
4. Click **Add** in the **Assignments** section and enter the following data.

**Table 16: Assigning a Password Policy**

<table>

**To specify an application scope**

a. Click ➔ next to the text box.

b. Select one of the following references under **Table**:
   - The table that contains the base objects of synchronization.
   - To apply the password policy based on the account definition, select the **TSBAccountDef** table.
   - Select the **TSBBehavior** table to apply the password policy based on the manage level.

c. Select the table that contains the base objects under **Apply to**.
   - If you have selected the table containing the base objects of synchronization, next select the specific target system.
   - If you have selected the **TSBAccountDef** table, next select the specific account definition.
   - If you have selected the **TSBBehavior** table, next select the specific manage level.

d. Click **OK**.

<table>
<thead>
<tr>
<th>Password column</th>
<th>The password column's identifier.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password policy</td>
<td>The identifier of the password policy to be used.</td>
</tr>
</tbody>
</table>

5. Save the changes.

**To change a password policy's assignment**

1. In the Manager, select the **Cloud target systems** | **Basic configuration data** | **Password policies** category.
2. Select the password policy in the result list.
3. Select **Assign objects**.
4. Select the assignment you want to change in **Assignments**.
5. Select the new password policy to apply from the **Password Policies** menu.
6. Save the changes.
Editing password policies

To edit a password policy

1. In the Manager, select the **Cloud target systems** | **Basic configuration data** | **Password policies** category.
2. Select the password policy in the result list and select **Change master data**.
   - OR -
   Click in the result list.
3. Edit the password policy's master data.
4. Save the changes.

Detailed information about this topic

- Policy settings on page 58
- Character classes for passwords on page 59
- Custom scripts for password requirements on page 60

General master data for a password policy

Enter the following master data for a password policy.

**Table 17: Master data for a password policy**

<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Password policy name. Translate the given text using the button.</td>
</tr>
<tr>
<td>Description</td>
<td>Spare text box for additional explanation. Translate the given text using the button.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Custom error message outputted if the policy is not fulfilled. Translate the given text using the button.</td>
</tr>
<tr>
<td>Owner (Application Role)</td>
<td>Application roles whose members can configure the password policies.</td>
</tr>
<tr>
<td>Default policy</td>
<td>Mark as default policy for passwords.</td>
</tr>
</tbody>
</table>

**NOTE:** The One Identity Manager password policy is marked as the default policy. This password policy is applied if no other password policy can be found for employees, user accounts or system users.
Policy settings

Define the following settings for a password policy on the Password tab.

Table 18: Policy settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial password</td>
<td>Initial password for newly created user accounts. If a password is not entered or if a random password is not generated when a user account is created, the initial password is used.</td>
</tr>
<tr>
<td>Password confirmation</td>
<td>Reconfirm password.</td>
</tr>
<tr>
<td>Minimum Length</td>
<td>Minimum length of the password. Specify the number of characters a password must have.</td>
</tr>
<tr>
<td>Max. length</td>
<td>Maximum length of the password. Specify the number of characters a password can have.</td>
</tr>
<tr>
<td>Max. errors</td>
<td>Maximum number of errors. Set the number of invalid passwords. Only taken into account when logging in to One Identity Manager.</td>
</tr>
<tr>
<td></td>
<td>This data is only taken into account if the One Identity Manager login was through a system user or employee based authentication module. If a user has reached the number of maximum failed logins, the employee or system user can no longer log in to One Identity Manager.</td>
</tr>
<tr>
<td></td>
<td>You can reset the passwords of employees and system users who have been blocked in Password Reset Portal. For more detailed information, see the One Identity Manager Web Portal User Guide.</td>
</tr>
<tr>
<td>Validity period</td>
<td>Maximum age of the password. Enter the length of time a password can be used before it expires.</td>
</tr>
<tr>
<td>Password history</td>
<td>Enter the number of passwords to be saved. If, for example, a value of 5 is entered, the user's last five passwords are stored.</td>
</tr>
<tr>
<td>Minimum password strength</td>
<td>Specifies how secure the password must be. The higher the password strength, the more secure it is. The value 0 means that the password strength is not tested. The values 1, 2, 3 and 4 specify the required complexity of the password. The value 1 represents the lowest requirements in terms of password strength. The value 4 requires the highest level of complexity.</td>
</tr>
</tbody>
</table>
| Name properties denied   | Specifies whether name properties are permitted or not permitted in the password. If this option is enabled, name
Character classes for passwords

Use the **Character classes** tab to specify which characters are permitted for a password.

### Table 19: Character classes for passwords

<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min. number letters</td>
<td>Specifies the minimum number of alphabetical characters the password must contain.</td>
</tr>
<tr>
<td>Min. number lowercase</td>
<td>Specifies the minimum number of lowercase letters the password must contain.</td>
</tr>
<tr>
<td>Min. number uppercase</td>
<td>Specifies the minimum number of uppercase letters the password must contain.</td>
</tr>
<tr>
<td>Min. number digits</td>
<td>Specifies the minimum number of digits the password must contain.</td>
</tr>
<tr>
<td>Min. number special characters</td>
<td>Specifies the minimum number of special characters the password must contain.</td>
</tr>
<tr>
<td>Permitted special characters</td>
<td>List of permitted characters.</td>
</tr>
<tr>
<td>Max. identical characters in total</td>
<td>Maximum number of identical characters that can be present in the password in total.</td>
</tr>
<tr>
<td>Max. identical characters in succession</td>
<td>Maximum number of identical character that can be repeated after each other.</td>
</tr>
<tr>
<td>Denied special characters</td>
<td>List of characters, which are not permitted.</td>
</tr>
<tr>
<td>Lowercase not allowed</td>
<td>Specifies whether the password can contain lower case letters. This setting is only applies when passwords are generated.</td>
</tr>
<tr>
<td>Uppercase not allowed</td>
<td>Specifies whether the password can contain upper case letters. This setting is only applies when passwords are generated.</td>
</tr>
</tbody>
</table>
| Digits not allowed               | Specifies whether the password can contain digits. This setting is
<table>
<thead>
<tr>
<th>Property</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Special characters not allowed</td>
<td>Specifies whether the password can contain special characters. This setting is only applies when passwords are generated.</td>
</tr>
</tbody>
</table>

**Custom scripts for password requirements**

You can implement custom scripts for testing and generating password if the password requirements cannot be mapped with the existing settings options. Scripts are applied in addition to the other settings.

**Detailed information about this topic**

- Script for checking a password on page 60
- Script for generating a password on page 61

**Script for checking a password**

You can implement a check script if additional policies need to be used for checking a password, which cannot be mapped with the available settings.

**Syntax for Check Scripts**

```vbnet
Public Sub CCC_CustomPwdValidate(policy As VI.DB.Passwords.PasswordPolicy, spwd As System.Security.SecureString)
    With parameters:
    policy = password policy object
    spwd = password to test
    TIP: To use a base object, take the property Entity of the PasswordPolicy class.
```

**Example for a script for testing a password**

A password cannot start with ? or !. The script checks a given password for validity.

```vbnet
Public Sub CCC_PwdValidate(policy As VI.DB.Passwords.PasswordPolicy, spwd As System.Security.SecureString)
    Dim pwd = spwd.ToInsecureArray()
    If pwd.Length>0
        If pwd(0)="?" Or pwd(0)="!"
```
Throw New Exception(#LD("Password can't start with '?' or '!'")#)
   End If
End If
If pwd.Length>2
   If pwd(0) = pwd(1) AndAlso pwd(1) = pwd(2)
      Throw New Exception(#LD("Invalid character sequence in password")#)
   End If
End If
End Sub

To use a custom script for checking a password

1. Create your script in the category Script Library in the Designer.
2. Edit the password policy.
   a. In the Manager, select the Cloud target systems | Basic configuration data | Password policies category.
   b. Enter the name of the script to be used to check a password in the Check script input field on the Scripts tab.
   c. Save the changes.

Related topics
   - Script for generating a password on page 61

Script for generating a password

You can implement a generating script if additional policies need to be used for generating a random password, which cannot be mapped with the available settings.

Syntax for generating script

Public Sub CCC_PwdGenerate( policy As VI.DB.Passwords.PasswordPolicy, spwd As System.Security.SecureString)
   With parameters:
      policy = password policy object
      spwd = generated password
   TIP: To use a base object, take the property Entity of the PasswordPolicy class.

Example for a script to generate a password

In random passwords, the script replaces the ? and ! characters, which are not permitted.
Public Sub CCC_PwdGenerate( policy As VI.DB.Passwords.PasswordPolicy, spwd As System.Security.SecureString)
    Dim pwd = spwd.ToInsecureArray()
    ' replace invalid characters at first position
    If pwd.Length>0
        If pwd(0)="?" Or pwd(0)="!
            spwd.SetAt(0, CChar("_"))
        End If
    End If
End Sub

To use a custom script for generating a password

1. Create your script in the category Script Library in the Designer.
2. Edit the password policy.
   a. In the Manager, select the Cloud target systems | Basic configuration data | Password policies category.
   b. Enter the name of the script to be used to generate a password in the Generating script input field on the Scripts tab.
   c. Save the changes.

Related topics

- Script for checking a password on page 60

Excluded list for passwords

You can add words to a list of restricted terms to prohibit them from being used in passwords.

⚠️ NOTE: The restricted list applies globally to all password policies.

To add a term to the restricted list

1. Select Base Data | Security settings | Restricted passwords in Designer.
2. Create a new entry with Object | New an enter the term to excluded to the list.
3. Save the changes.
Checking a password

When you test a password, all the password policy settings, custom scripts and the restricted passwords are taken into account.

To test whether a password conforms to the password policy

1. In the Manager, select the Cloud target systems | Basic configuration data | Password policies category.
2. Select the Test tab.
3. Select the table and object to be tested in Base object for test.
4. Enter a password in Enter password to test.
   A display next to the password shows whether it is valid or not.

Testing generation of a password

When you generate a password, all the password policy settings, custom scripts and the restricted passwords are taken into account.

To generate a password that conforms to the password policy

1. In the Manager, select the Cloud target systems | Basic configuration data | Password policies category.
2. Select the Test tab.
3. Click Generate.
   This generates and displays a password.

Initial password for new user accounts

Table 20: Configuration parameters for formatting initial passwords for user accounts

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>QER\Person\UseCentralPassword</td>
<td>This configuration parameter specifies whether the employee’s central password is used in the user accounts. The employee’s central password is</td>
</tr>
</tbody>
</table>
**Configuration parameter** | **Meaning**
--- | ---
 | automatically mapped to the employee’s user account in all permitted target systems. This excludes privileged user accounts, which are not updated.
QER\Person\UseCentralPassword\PermanentStore | This configuration parameter controls the storage period for central passwords. If the parameter is set, the employee’s central password is permanently stored. If the parameter is not set, the central password is only to publicize the target system and is subsequently deleted from the One Identity Manager database.
TargetSystem\CSM\Accounts\InitialRandomPassword | This configuration parameter specifies whether a random generated password is issued when a new user account is added. The password must contain at least those character sets that are defined in the password policy.

You have the following possible options for issuing an initial password for a new user account.

- Create user accounts manually and enter a password in their master data.
- Assign a randomly generated initial password to enter when you create user accounts.
  - Enable the **TargetSystem | CSM | Accounts | InitialRandomPassword** configuration parameter in Designer.
  - Apply target system specific password policies and define the character sets that the password must contain.
  - Specify which employee will receive the initial password by email.
• User the employee's central password. The employee’s central password is mapped to the user account password. For detailed information about an employee’s central password, see One Identity Manager Identity Management Base Module Administration Guide.

Related topics
• Password policies for user accounts on page 53
• Email notifications about login data on page 65

Email notifications about login data

You can configure the login information for new user accounts to be sent by email to a specified person. In this case, two messages are sent with the user name and the initial password. Mail templates are used to generate the messages. The mail text in a mail template is defined in several languages, which means the recipient’s language can be taken into account when the email is generated. Mail templates are supplied in the default installation with which you can configure the notification procedure.

The following prerequisites must be fulfilled in order to use notifications:

1. Ensure that the email notification system is configured in One Identity Manager. For more detailed information, see the One Identity Manager Installation Guide.
2. In Designer, enable the Common | MailNotification | DefaultSender configuration parameter and enter the sender address for sending the email notifications.
3. Ensure that all employees have a default email address. Notifications are sent to this address. For more detailed information, see the One Identity Manager Identity Management Base Module Administration Guide.
4. Ensure that a language can be determined for all employees. Only then can they receive email notifications in their own language. For more detailed information, see the One Identity Manager Identity Management Base Module Administration Guide.

When a randomly generated password is issued for the new user account, the initial login data for a user account is sent by email to a previously specified person.

To send initial login data by email

1. In the Designer, activate the configuration parameter TargetSystem | CSM | Accounts | InitialRandomPassword.
2. In the Designer, activate the configuration parameter TargetSystem | CSM | Accounts | InitialRandomPassword | SendTo and enter the recipient of the notification as a value.
3. In the Designer, activate the configuration parameter TargetSystem | CSM | Accounts | InitialRandomPassword | SendTo | MailTemplateAccountName.
By default, the message sent uses the mail template **Employee - new user account created**. The message contains the name of the user account.

4. In the Designer, activate the configuration parameter **TargetSystem | CSM | Accounts | InitialRandomPassword | SendTo | MailTemplatePassword**.

By default, the message sent uses the mail template **Employee - initial password for new user account**. The message contains the initial password for the user account.

**TIP:** Change the value of the configuration parameter in order to use custom mail templates for these mails.

## Target system managers

A default application role exists for the target system manager in One Identity Manager. Assign the employees who are authorized to edit all cloud target system in One Identity Manager to this application role.

ns for target system managers to individual farms. SharePoint Define additional application roles if you want to limit the edit permissions for target system managers to individual cloud target systems. The application roles must be added under the default application role.

For detailed information about implementing and editing application roles, see the *One Identity Manager Authorization and Authentication Guide*.

### Implementing application roles for target system managers

1. The One Identity Manager administrator assigns employees to be target system managers.

2. These target system managers add employees to the default application role for target system managers.

   Target system managers with the default application role are authorized to edit all cloud target systems in One Identity Manager.

3. Target system managers can authorize other employees within their area of responsibility as target system managers and if necessary, create additional child application roles and assign these to individual cloud target systems.

### Table 21: Default Application Roles for Target System Managers

<table>
<thead>
<tr>
<th>User</th>
<th>Tasks</th>
</tr>
</thead>
</table>
| Target system managers      | Target system managers must be assigned to the application role **Target systems** | Cloud target systems or a sub application role. Users with this application role:
<table>
<thead>
<tr>
<th>User</th>
<th>Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Assume administrative tasks for the target system.</td>
<td></td>
</tr>
<tr>
<td>• Create, change or delete target system objects, like user accounts or groups.</td>
<td></td>
</tr>
<tr>
<td>• Edit password policies for the target system.</td>
<td></td>
</tr>
<tr>
<td>• Prepare groups for adding to the IT Shop.</td>
<td></td>
</tr>
<tr>
<td>• Can add employees, who have an other identity than the <strong>Primary identity</strong>.</td>
<td></td>
</tr>
<tr>
<td>• Configure synchronization in the Synchronization Editor and defines the mapping for comparing target systems and One Identity Manager.</td>
<td></td>
</tr>
<tr>
<td>• Edit the synchronization's target system types and outstanding objects.</td>
<td></td>
</tr>
<tr>
<td>• Authorize other employees within their area of responsibility as target system managers and create child application roles if required.</td>
<td></td>
</tr>
</tbody>
</table>

**To initially specify employees to be target system administrators**

1. Log in to One Identity Manager as Manager administrator (**Base role | Administrators**)
2. Select **One Identity Manager Administration | Target systems | Administrators**.
3. Select **Assign employees**.
4. Assign the employee you want and save the changes.

**To add the first employees to the default application as target system managers.**

1. Log yourself into Manager as target system administrator (**Target systems | Administrators**).
2. Select **One Identity Manager Administration | Target systems | Cloud target systems**.
3. Select **Assign employees** in the task view.
4. Assign the employees you want and save the changes.

**To authorize other employees as target system managers when you are a target system manager**

1. Login to Manager as target system manager.
2. Select the application role in **Custom Target Systems | Basic configuration data | Target system managers**.
3. Select **Assign employees**.
4. Assign the employees you want and save the changes.

**To specify target system managers for individual cloud target systems**

1. Log in to Manager as target system manager.
2. Select the category **Cloud Target Systems | Basic configuration data | Cloud target systems**.
3. Select the target system in the result list.
4. Select **Change master data**.
5. On the **General** tab, select the application role in the **Target system manager** menu.
   - OR -
   Next to the **Target system manager** menu, click 📊 to create a new application role.
   a. Enter the application role name and assign the **Target systems | Cloud target systems** parent application role.
   b. Click **OK** to add the new application role.
6. Save the changes.
7. Assign employees to this application role who are permitted to edit the target system in One Identity Manager.

**Editing a server**

In order to handle One Identity Manager specific processes in Universal Cloud Interface, the synchronization server and its server functionality must be declared. You have several options for defining a server's functionality:

- Create an entry for the Job server in Designer under **Base Data | Installation | Job server**. For detailed information, see One Identity Manager Configuration Guide.

- Select an entry for the Job server in **Cloud Target Systems | Basic configuration data | Server** in the Manager and edit the Job server master data. Use this task if the Job server has already been declared in One Identity Manager and you want to configure special functions for the Job server.
NOTE: One Identity Manager must be installed, configured, and started in order for a server to execute its function in the One Identity Manager Service network. Proceed as described in the One Identity Manager Installation Guide.

To edit a Job server and its functions

1. Select Cloud target systems | Basic configuration data | Server in Manager.
2. Select the Job server entry in the result list.
3. Select Change master data.
4. Edit the Job server’s master data.
5. Select Assign server functions in the task view and specify server functionality.
6. Save the changes.

</tbody>
</table>

**NOTE:** If you select **No synchronization**, you can define custom processes to exchange data between One Identity Manager and the target system.

**Description**

Spare text box for additional explanation.

**Manual provisioning**

Specifies whether changes to cloud objects in the One Identity Manager database are automatically provisioned in the cloud application. If this option is not set, processes for automatic provisioning of object modifications are configured.

Set this option, if object modifications are not allowed to be published automatically in the cloud application. Use the Web Portal to transfer the changes to the cloud application. For more detailed information about provisioning object modifications, see the One Identity Manager Administration Guide for Connecting to Cloud Applications.

**IMPORTANT:** If you set this option, ensure that data, using regular and frequent synchronization,

- between the Universal Cloud Interface Module and the cloud application and
- between the modules Universal Cloud Interface and Cloud Systems Management

is kept consistent!

**User account deletion not permitted**

Specifies whether user accounts in the cloud target system can be deleted. If this option is set, user account can only be disabled.

**Related topics**

- Automatic assignment of employees to user accounts on page 94

Specifying categories for inheriting groups

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can be freely selected and are specified using a mapping rule. Each category is given a specific position within the template. The template contains two tables; the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions Position 1 to Position 31.

To define a category
1. In Manager, select the target system in Cloud target systems.
2. Select Change master data.
3. Switch to the Mapping rule category tab.
4. Extend the relevant roots of the user account table or group table.
5. Click ☒ to enable category.
6. Enter a category name of your choice for user accounts and groups and in the login language used.
7. Save the changes.

Detailed information about this topic
- Group inheritance based on categories on page 114

Alternative column names

If you require different names for input fields to those on the master data form, you can specify a language-dependent alternative column name for each object type.

To specify alternative column names
1. Select the category Cloud Target Systems | Basic configuration data | Cloud target systems.
2. In the result list, select a target system. Select Change master data.
3. Select the tab Alternative column names.
4. Open the membership tree in the table whose column name you want to change.
   All the columns in this table are listed with their default column names.
5. Enter any name in the login language in use.
6. Save the changes.

**Editing a synchronization project**

Synchronization projects in which a Cloud target system is already used as a base object can also be opened in Manager. You can, for example, check the configuration or view the synchronization log in this mode. The Synchronization Editor is not started with its full functionality. You cannot run certain functions, such as, running synchronization or simulation, starting the target system browser and others.

**NOTE:** Manager is locked for editing throughout. To edit objects in Manager, close the Synchronization Editor.

To open an existing synchronization project in the Synchronization Editor:
1. Select the category **Cloud Target Systems | Basic configuration data | Cloud target systems**.
2. Select the target system in the result list. Select **Change master data**.
3. Select **Edit synchronization project...** from the task view.

**Related topics**
- Customizing synchronization configuration on page 24
Container structures in a cloud target system

The container structure represents the structure elements of a cloud target system. Containers are represented by a hierarchical tree structure.

To edit container master data

1. Select the category Cloud Target Systems | <target system> | Container structure.
2. Select the container in the result list and run the Change master data task.
   - OR -
   Click in the result list.
3. Edit the container's master data.
4. Save the changes.

Enter the following master data for a container.

Table 26: Master Data for a Container

Cloud user accounts

You manage cloud application user accounts with One Identity Manager. User accounts obtain the permissions required to access cloud resources through membership in groups and permissions controls.

Detailed information about this topic

- Linking user accounts to employees on page 80
- Supported user account types on page 81
- Entering user account master data on page 85

Linking user accounts to employees

The central component of the One Identity Manager is to map employees and their master data with permissions through which they have control over different target systems. For this purpose, information about user accounts and permissions can be read from the target system into the One Identity Manager database and linked to employees. This gives an overview of the permissions for each employee in all of the connected target systems. One Identity Manager provides the possibility to manage user accounts and their permissions. You can provision modifications in the target systems. Employees are supplied with the necessary permissions in the connected target systems according to their function in the company. Regular synchronization keeps data consistent between target systems and the One Identity Manager database.

Because requirements vary between companies, the One Identity Manager offers different methods for supplying user accounts to employees. One Identity Manager supports the following method for linking employees and their user accounts.

- Employees can automatically obtain their account definitions using user account resources. If an employee does not yet have a user account in a target system, a new user account is created. This is done by assigning account definitions to an employee using the integrated inheritance mechanism and subsequent process handling.
When you manage account definitions through user accounts, you can specify the way user accounts behave when employees are enabled or deleted.

- When user accounts are inserted, they can be automatically assigned to an existing employee or a new employee can be created if necessary. In the process, the employee master data is created on the basis of existing user account master data. This mechanism can be implemented if a new user account is created manually or by synchronization. However, this is not the One Identity Manager default method. Define criteria for finding employees for automatic employee assignment.
- Employees and user accounts can be entered manually and assigned to each other.

For detailed information about employee handling and administration, see the One Identity Manager Target System Base Module Administration Guide.

## Supported user account types

Different types of user accounts, such as default user accounts, administrative user accounts, service accounts, or privileged user accounts can be mapped in One Identity Manager.

The following properties are used for mapping different user account types.

- **Identity**
  The **Identity** property (IdentityType column) is used to describe the type of user account.

### Table 27: Identities of user accounts

<table>
<thead>
<tr>
<th>Identity</th>
<th>Description</th>
<th>Value of the IdentityType column</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary identity</td>
<td>Employee's default user account.</td>
<td>Primary</td>
</tr>
<tr>
<td>Organizational identity</td>
<td>Secondary user account used for different roles in the organization, for example for subcontracts with other functional areas.</td>
<td>Organizational</td>
</tr>
<tr>
<td>Personalized</td>
<td>User account with administrative permissions,</td>
<td>Admin</td>
</tr>
<tr>
<td>Identity</td>
<td>Description</td>
<td>Value of the IdentityType column</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>admin identity</td>
<td>used by one employee.</td>
<td></td>
</tr>
<tr>
<td>Sponsored identity</td>
<td>User account that is used for training purposes, for example.</td>
<td>Sponsored</td>
</tr>
<tr>
<td>Shared identity</td>
<td>User account with administrative permissions, used by several employees.</td>
<td>Shared</td>
</tr>
<tr>
<td>Service identity</td>
<td>Service account.</td>
<td>Service</td>
</tr>
</tbody>
</table>

**NOTE:** To enable working with identities for user accounts, the employees also need identities. You can only link user accounts to which an identity is assigned with employees who have this same identity.

The primary identity, the organizational identity, and the personal admin identity are used for different user accounts, which can be used by the same actual employee to execute their different tasks within the company.

To provide user accounts with a personal admin identity or an organizational identity for an employee, you create subidentities for the employee. These subidentities are then linked to user accounts, enabling you to assign the required Entitlements to the different user accounts.

User accounts with a sponsored identity, group identity, or service identity are linked to dummy employees that do not refer to a real person. These dummy employees are needed so that Entitlements can be inherited by the user accounts. When evaluating reports, attestations, or compliance checks, check whether dummy employees need to be considered separately.

For detailed information about mapping employee identities, see the One Identity Manager Identity Management Base Module Administration Guide.

- Privileged user account

Privileged user accounts are used to provide employees with additional privileges. This includes administrative user accounts or service accounts, for example. The user accounts are marked as **Privileged user account** (Column IsPrivilegedAccount).

**Default User Accounts**

Normally, each employee obtains a default user account, which has the permissions they require for their regular work. The user accounts are linked to the employee. The effect of the link and the scope of the employee’s inherited properties on the user accounts can be configured through an account definition and its manage levels.
To create default user accounts through account definitions

1. Create an account definition and assign the **Unmanaged** and **Full managed** manage levels.
2. Specify the effect of temporarily or permanently disabling, deleting or the security risk of an employee on its user accounts and group memberships for each manage level.
3. Create a formatting rule for IT operating data.
   You use the mapping rule to define which rules are used to map the IT operating data for the user accounts, and which default values are used if no IT operating data can be determined via a person’s primary roles.
   Which IT operating data is required depends on the target system. The following setting are recommended for default user accounts:
   - In the mapping rule for the IsGroupAccount column, use the default value **1** and enable **Always use default value**.
   - In the mapping rule for the IdentityType column, use the default value **Primary** and enable **Always use default value**.
4. Enter the effective IT operating data for the target system. Select the concrete target system under **Effects on**.
   Specify in the departments, cost centers, locations, or business roles which IT operating data should apply when you set up a user account.
5. Assign the account definition to employees.
   When the account definition is assigned to an employee, a new user account is created through the inheritance mechanism and subsequent processing.

**Administrative User Accounts**

An administrative user account must be used for certain administrative tasks. Administrative user accounts are usually predefined by the target system and have fixed names and login names, such as **Administrator**.

Administrative user accounts are imported into One Identity Manager during synchronization.

**NOTE:** Some administrative user accounts can be automatically identified as privileged user accounts. To do this, enable the **Mark selected user accounts as privileged** schedule in Designer.

You can label administrative user accounts as a **Personalized administrator identity** or as a **Shared identity**. Proceed as follows to provide the employees who use this user account with the required permissions.

- **Personalized admin identity**
  1. Use the UID Person column to link the user account with an employee.
     Use an employee with the same identity or create a new employee.
2. Assign this employee to hierarchical roles.
   - Shared identity
     1. Assign all employees with usage authorization to the user account.
     2. Link the user account to a dummy employee using the UID_Person column.
        Use an employee with the same identity or create a new employee.
     3. Assign this dummy employee to hierarchical roles.
        The dummy employee provides the user account with its permissions.

Privileged User Accounts

Privileged user accounts are used to provide employees with additional privileges. This includes administrative user accounts or service accounts, for example. The user accounts are marked as Privileged user account (Column IsPrivilegedAccount).

**NOTE:** The criteria according to which user accounts are automatically identified as privileged are defined as extensions to the view definition (ViewAddOn) in the TSBVAccountIsPrivDetectRule table (which is a table of the Union type). The evaluation is done in the script TSB_SetIsPrivilegedAccount.

To create privileged users through account definitions

1. Create an account definition. Create a new manage level for privileged user accounts and assign this manage level to the account definition.
2. If you want to prevent the properties for privileged user accounts from being overwritten, set the IT operating data overwrites property for the manage level to Only initially. In this case, the properties are populated just once when the user accounts is created.
3. Specify the effect of temporarily or permanently disabling or deleting, or the security risk of an employee on its user accounts and group memberships for each manage level.
4. Create a formatting rule for IT operating data.
   You use the mapping rule to define which rules are used to map the IT operating data for the user accounts, and which default values are used if no IT operating data can be determined via a person's primary roles.

Which IT operating data is required depends on the target system. The following settings are recommended for privileged user accounts:

- In the mapping rule for the IsPrivilegedAccount column, use the default value 1 and enable Always use default value.
- You can also specify a mapping rule for the IdentityType column. The column owns different permitted values that represent user accounts.
- To prevent privileged user accounts from inheriting the entitlements of the default user, define a mapping rule for the IsGroupAccount column with a default value of 0 and enable Always use default value.
5. Enter the effective IT operating data for the target system.
   Specify in the departments, cost centers, locations, or business roles which IT operating data should apply when you set up a user account.

6. Assign the account definition directly to employees who work with privileged user accounts.
   When the account definition is assigned to an employee, a new user account is created through the inheritance mechanism and subsequent processing.

   **TIP:** If customization requires that the login names of privileged user accounts follow a defined naming convention, create the template according to which the login names are formed.

### Entering user account master data

A user account can be linked to an employee in One Identity Manager. You can also manage user accounts separately from employees.

   **NOTE:** It is recommended to use account definitions to set up user accounts for company employees. In this case, some of the master data described in the following is mapped through templates from employee master data.

   **NOTE:** If employees are to obtain their user accounts through account definitions, the employees must own a central user account and obtain their IT operating data through assignment to a primary department, a primary location or a primary cost center.

#### To create a user account

1. In Manager, select **Cloud Target Systems | <target system> | User accounts**.
2. Click in the result list.
3. On the master data form, edit the master data for the user account.
4. Save the changes.

#### To edit master data for a user account

1. In Manager, select **Cloud Target Systems | <target system> | User accounts**.
2. Select the user account in the result list and run **Change master data**.
3. Edit the user account's resource data.
4. Save the changes.

#### To manually assign or create a user account for an employee

1. Select the **Employees | Employees**.
2. Select the employee in the result list and run **Assign cloud user accounts** from the
3. Assign a user account.
4. Save the changes.

## Additional tasks for managing user accounts

After you have entered the master data, you can run the following tasks.

### Overview of the user account

Use this task to obtain an overview of the most important information about a user account.

**To obtain an overview of a user account**

1. Select the category **Cloud Target Systems | <target system> | User accounts**.
2. Select the user account in the result list.
3. Select **User account overview** in the task view.

### Assigning groups directly to user accounts

Cloud groups can be assigned directly or indirectly to a user account. Indirect assignment is carried out by allocating the employee and groups in hierarchical roles, such as departments, cost centers, locations, or business roles. If the employee has a cloud user account, cloud groups in the hierarchical roles are inherited by this user account.

**To assign groups directly to user accounts**

1. In Manager, select **Cloud Target Systems | <target system> | User accounts**.
2. Select the user account in the result list.
3. Select **Assign groups**.
4. Assign groups in **Add assignments**.

   **TIP:** you can remove the assignment of groups in the **Remove assignments** area.

   *To remove an assignment*
   - Select the group and double click 🔄.

5. Save the changes.

   **NOTE:** The primary group of a user account is already assigned and is marked as **Does not apply yet**. Edit the user account’s master data to change its primary group.

**Related topics**
- Assigning groups to user accounts on page 104

**Assigning permissions controls**

Use this task to assign permissions controls directly to user accounts.

**To assign permissions controls to a user account**

1. Select the category **Cloud Target Systems** | <target system> | **User accounts**.
2. Select the user account in the result list.
3. Select **Assign permissions controls**.
4. Assign permissions controls in **Add assignments**.
   - OR -
   - Remove permissions controls from **Remove assignments**.
5. Save the changes.

**Assigning extended properties**

Extended properties are meta objects that cannot be mapped directly in One Identity Manager, for example, operating codes, cost codes or cost accounting areas.

**To specify extended properties for a user account**

1. Select the category **Cloud Target Systems** | <target system> | **User accounts**.
2. Select the user account in the result list.
3. Select **Assign extended properties** in the task view.
4. Assign extended properties in **Add assignments**.
   - OR -
     Remove extended properties from **Remove assignments**.
5. Save the changes.

For more detailed information about setting up extended properties, see the One Identity Manager Identity Management Base Module Administration Guide.

## Automatic assignment of employees to user accounts

### Table 34: Configuration parameters for synchronizing a cloud application

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TargetSystem\CSM\PersonAutoDefault</td>
<td>This configuration parameter specifies the mode for automatic employee assignment for user accounts added to the database outside synchronization.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonAutoDisabledAccounts</td>
<td>This configuration parameter specifies whether employees are automatically assigned to disable user accounts. User accounts do not obtain an account definition.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonAutoFullSync</td>
<td>This configuration parameter specifies the mode for automatic employee assignment for user accounts added to or updated in the database through synchronization.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonExcludeList</td>
<td>List of all user accounts for which automatic employee assignment should not take place. Names are listed in a pipe (</td>
</tr>
</tbody>
</table>

When you add a user account, an existing employee can be assigned automatically or added if necessary. In the process, the employee master data is created on the basis of existing user account master data. This mechanism can follow on after a new user account has been created manually or through synchronization. Define criteria for finding employees to apply to automatic employee assignment. If a user account is linked to an employee through the current mode, the user account is given, through an internal process, the default manage level of the account definition entered in the user account’s
target system. You can customize user account properties depending on how the behavior of the manage level is defined.

If you run this procedure during working hours, automatic assignment of employees to user accounts takes place from that moment onwards. If you disable the procedure again later, the changes only affect user accounts added or updated after this point in time. Existing employee assignment to user accounts remain intact.

**NOTE:** It is not recommended to assign employees using automatic employee assignment in the case of administrative user accounts. Use Change master data to assign employees to administrative user account for the respective user account.

Run the following tasks to assign employees automatically.

- If employees can be assigned by user accounts during synchronization, set the parameter "TargetSystem\CSM\PersonAutoFullsync" in the Designer and select the required mode.
- If employees can be assigned by user accounts outside synchronization, set the parameter "TargetSystem\CSM\PersonAutoDefault" in the Designer and select the required mode.
- Specify the user accounts in the configuration parameter "TargetSystem\CSM\PersonExcludeList" which must not be assigned automatically to employees.
  
  Example:
  
  ADMINISTRATOR

- Assign an account definition to the cloud target system. Ensure that the manage level to be used is entered as the default manage level.
- Define the search criteria for employees assigned to the cloud target system.

**NOTE:**

The following applies for synchronization:

- Automatic employee assignment takes effect if user accounts are added or updated.

The following applies outside synchronization:

- Automatic employee assignment takes effect if user accounts are added.
NOTE:
Following a synchronization, employees are automatically created for the user accounts in the default installation. If an account definition for the target system is not yet known at the time of synchronization, user accounts are linked with employees. However, account definitions are not assigned. The user accounts are therefore in a **Linked** state.

To manage the user accounts using account definitions, assign an account definition and a manage level to these user accounts.

**To select user accounts through account definitions**

1. Create an account definition.
2. Assign an account definition to the target system.
3. Assign the account definition and manage level to user accounts in **linked** status.
   a. In Manager, select **Cloud target systems** | `<Target system>` | **User accounts** | **Linked but not configured** | `<Target system>`.
   b. Select **Assign account definition to linked accounts**.

For detailed information about assigning employees automatically, see the One Identity Manager Target System Base Module Administration Guide.

**Related topics**

- Creating an account definition on page 35
- Assigning account definitions to a cloud target system on page 50
- Editing search criteria for automatic employee assignment on page 96

**Editing search criteria for automatic employee assignment**

The criteria for employee assignment are defined for the target system. In this case, you specify which user account properties must match the employee’s properties such that the employee can be assigned to the user account. You can limit search criteria further by using format definitions. The search criterion is written in XML notation to the **Search criteria for automatic employee assignment** column (AccountToPersonMatchingRule) in the CSMRoot table.

Search criteria are evaluated when employees are automatically assigned to user accounts. Furthermore, you can create a suggestion list for assignments of employees to user accounts based on the search criteria and make the assignment directly.
NOTE: When the employees are assigned to user accounts on the basis of search criteria, user accounts are given the default manage level of the account definition entered in the user account's target system. You can customize user account properties depending on how the behavior of the manage level is defined.

It is not recommended to make assignment to administrative user accounts based on search criteria. Use Change master data to assign employees to administrative user account for the respective user account.

**To define employee assignment criteria for a cloud target system**

1. Select the category Cloud Target Systems | Basic configuration data | Cloud target systems.
2. Select the target system in the result list.
3. Select Define search criteria for employee assignment in the task view.
4. Specify which user account properties must match with which employee so that the employee is linked to the user account.

**Table 35: Example of search criteria for user accounts**

<table>
<thead>
<tr>
<th>Apply to</th>
<th>Column for employee</th>
<th>Column for user account</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud User Accounts</td>
<td>FirstName AND LastName</td>
<td>FirstName AND LastName</td>
</tr>
</tbody>
</table>

5. Save the changes.

**Direct assignment of employees to user accounts based on a suggestion list**

In Assignments, you can create a suggestion list for assignments of employees to user accounts based on the search criteria and make the assignment directly. User accounts are grouped in different views for this.

**Table 36: Manual Assignment View**

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suggested assignments</td>
<td>This view lists all user accounts to which One Identity Manager can assign an employee. All employees are shown who were found using the search criteria and can be assigned.</td>
</tr>
<tr>
<td>Assigned user accounts</td>
<td>This view lists all user accounts to which an employee is assigned.</td>
</tr>
<tr>
<td>Without employee assignment</td>
<td>This view lists all user accounts to which no employee is assigned and for which no employee was found using the search criteria.</td>
</tr>
</tbody>
</table>

**TIP:** By double-clicking on an entry in the view, you can view the user account and employee master data.
To apply search criteria to user accounts

- Click Reload.

All possible assignments based on the search criteria are found in the target system for all user accounts. The three views are updated.

To assign employees directly over a suggestion list

1. Click Suggested assignments.
   a. Click Select for all user accounts to which you want to assign the suggested employees. Multi-select is possible.
   b. Click Assign selected.
   c. Confirm the security prompt with Yes.
      The employees determined using the search criteria are assigned to the selected user accounts.

   -- OR --

2. Click No employee assignment.
   a. Click Select employee for the user account to which you want to assign an employee. Select an employee from the menu.
   b. Click Select for all user accounts to which you want to assign the selected employees. Multi-select is possible.
   c. Click Assign selected.
   d. Confirm the security prompt with Yes.
      The employees displayed in the Employee column are assigned to the selected user accounts.

To remove assignments

1. Click Assigned user accounts.
   a. Click Select for all user accounts for which you want to delete the employee assignment. Multi-select is possible.
   b. Click Remove selected.
   c. Confirm the security prompt with Yes.
      The assigned employees are removed from the selected user accounts.

For detailed information about defining search criteria, see the One Identity Manager Target System Base Module Administration Guide.

Locking and unlocking user accounts

The way you disable user accounts depends on how they are managed.

Scenario:

- The user account is linked to employees and is managed through account definitions.

User accounts managed through account definitions are disabled when the employee is temporarily or permanently disabled. The behavior depends on the user account manage level. Accounts with the manage level **Full managed** manage level are disabled depending on the account definition settings. For user accounts with a manage level, configure the required behavior using the template in the CSMUser.AccountDisabled

Scenario:

- The user accounts are linked to employees. No account definition is applied.

User accounts managed through user account definitions are disabled when the employee is temporarily or permanently disabled. The behavior depends on the QER | Person | TemporaryDeactivation configuration parameter

  - If the configuration parameter is set, the employee’s user accounts are disabled if the employee is permanently or temporarily disabled.
  - If the configuration parameter is not set, the employee’s properties do not have any effect on the associated user accounts.

**To disable the user account when the configuration parameter is disabled.**

1. In Manager, select Cloud Target Systems | <target system> | User accounts.
2. Select the user account in the result list.
3. Select Change master data.
4. Enable Account is disabled on the General tab.
5. Save the changes.

Scenario:

- User accounts not linked to employees.

**To disable a user account that is no longer linked to an employee.**

1. In Manager, select Cloud Target Systems | <target system> | User accounts.
2. Select the user account in the result list.
3. Select Change master data.
4. Enable Account is disabled on the General tab.
5. Save the changes.

Deleting user accounts

You can delete a user account from the result list or the menu base. After the security prompt has been confirmed, the user account is deleted from the One Identity Manager database.

Configuring deferred deletion

By default, user accounts are finally deleted from the database after 30 days. During this period you have the option to reactivate the user accounts. A restore is not possible once the delete delay has expired. You can configure an alternative deletion delay in Designer in the table CSMUser.

To delete a user account

1. Select the category Cloud Target Systems | <target system> | User accounts.
2. Select the user account in the result list.
3. Click ✗ in the result list.
4. Confirm the security prompt with Yes.

Once you have deleted a user account, it is also deleted in the Universal Cloud Interface Module through the provisioning process and then in the cloud application. The deletion is logged as a pending change. You can see whether the user account has been deleted in the cloud application from the process status for the pending change. The same applies if memberships of user accounts in groups are deleted.

User accounts are not allowed to be deleted in certain cloud applications. These user accounts cannot be deleted in the Manager, only disabled. You can configure the appropriate behavior in the cloud target system.

To prevent user accounts from being deleted

1. Select the category Cloud Target Systems | Basic configuration data | Cloud target systems.
2. Select the target system in the result list. Select Change master data.
3. Set the option User account deletion not permitted.
4. Save the changes.

Assigning groups to user accounts

cloud groups can be assigned directly or indirectly to employees. In the case of indirect assignment, employees and groups are arranged in hierarchical roles. The number of groups assigned to an employee is calculated from the position in the hierarchy and the direction of inheritance. If you add an employee to hierarchical roles and that employee
owns a cloud user account, this user account is added to the cloud group. Prerequisites for indirect assignment of employees to user accounts:

- Assignment of employees and cloud groups is permitted for role classes (department, cost center, location or business role).
- Cloud user accounts are marked with the option **Groups can be inherited**.
- Cloud user accounts and cloud groups belong to the same target system.

Furthermore, cloud groups can be assigned to employees through IT Shop requests. So that groups can be assigned using IT Shop requests, employees are added to a shop as customers. All groups are assigned to this shop can be requested by the customers. Requested groups are assigned to the employees after approval is granted.

For more detailed information about inheriting company resources, see the One Identity Manager Identity Management Base Module Administration Guide.

- Adding groups to the IT Shop on page 109

**Assigning groups to departments, cost centers, and locations**

Assign groups to departments, cost centers, and locations in order to assign user accounts to them through these organizations.

*To assign a group to departments, cost centers or locations (non role-based login)*

1. In the Manager, select the category Cloud Target Systems | <target system> | Groups category.
2. Select the group in the result list.
3. Select Assign organizations.
4. Assign organizations in Add assignments.
   - Assign departments on the Departments tab.
   - Assign locations on the Locations tab.
   - Assign cost centers on the Cost centers tab.
TIP: In the Remove assignments area, you can remove the assignment of organizations.

To remove an assignment
- Select the organization and double click ☑.

5. Save the changes.

To assign groups to a department, cost center or location (role-based login)
1. Select Organizations | Departments in Manager.
   - OR -
   Select Organizations | Cost centers in Manager.
   - OR -
   In Manager, select Organizations | Locations.
2. Select the department, cost center or location in the result list.
3. Select the Assign cloud groups task.
4. Assign groups in Add assignments.

   TIP: you can remove the assignment of groups in the Remove assignments area.

   To remove an assignment
   - Select the group and double click ☑.

5. Save the changes.

Assigning groups to business roles

Installed modules: Business Roles Module

You assign groups to business roles in order to assign them to user accounts over business roles.
To assign a group to a business role (non role-based login)

1. In the Manager, select the category **Cloud Target Systems** | **<target system>** | **Groups** category.
2. Select the group in the result list.
3. Select **Assign business roles** in the task view.
4. Assign business roles in **Add assignments**.

    **TIP:** In the **Remove assignments** area, you can remove the assignment of business roles.

    **To remove an assignment**
    - Select the business role and double click ✓.

5. Save the changes.

To assign groups to a business role (non role-based login)

1. In Manager, select **Business roles** | **<role class>**.
2. Select the business role in the result list.
3. Select **Assign cloud groups**.
4. Assign groups in **Add assignments**.

    **TIP:** you can remove the assignment of groups in the **Remove assignments** area.

    **To remove an assignment**
    - Select the group and double click ✓.

5. Save the changes.

- One Identity Manager users for managing cloud target systems on page 8

Assigning user accounts directly to a group

Groups can be assigned directly or indirectly to user accounts. Indirect assignment is carried out by allocating the employee and groups in company structures, like departments, cost centers, locations or business roles. If the employee has a user account in the cloud target system, the cloud groups in the role are inherited by this user account.

To react quickly to special requests, you can assign groups directly to user accounts.
To assign a group directly to user accounts

1. In the Manager, select the category Cloud Target Systems | <target system> | Groups category.
2. Select the group in the result list.
3. Select Assign user accounts in the task view.
4. Assign user accounts in Add assignments.
   - **TIP:** In the Remove assignments area, you can remove the assignment of user accounts.
   - To remove an assignment
     - Select the user account and double click.
5. Save the changes.

Adding groups to system roles

Installed modules: System Roles Module

Use this task to add a group to system roles. If you assign a system role to employees, all the user accounts belonging to these employees inherit the group.

**NOTE:** Groups with Only use in IT Shop set can only be assigned to system roles that also have this option set. For more detailed information, see the One Identity Manager System Roles Administration Guide.

To assign a group to system roles

1. In the Manager, select the category Cloud Target Systems | <target system> | Groups category.
2. Select the group in the result list.
3. Select Assign system roles in the task view.
4. Assign system roles in **Add assignments**.

   ![TIP: In the Remove assignments area, you can remove the assignment of system roles.](image)

   **To remove an assignment**
   - Select the system role and double click 📚.

5. Save the changes.

**Related topics**

---

**Adding groups to the IT Shop**

When you assign a group to an IT Shop shelf, it can be requested by the shop customers. To ensure it can be requested, further prerequisites need to be guaranteed.

- the group must be marked with the **IT Shop** option.
- the group must be assigned a service item.

   ![TIP: In Web Portal, all products that can be requested are grouped together by service category. To make the group easier to find in Web Portal, assign a service category to the service item.](image)

- If you only want it to be possible for the group to be assigned to employees through IT Shop requests, the group must also be labeled with the **Use only in IT Shop** option. Direct assignment to hierarchical roles or user accounts is no longer permitted.

   ![NOTE: With role-based login, the IT Shop administrators can assign groups to IT Shop shelves. Target system administrators are not authorized to add groups to IT Shop.](image)

**To add a group to IT Shop.**

1. In Manager, select **Cloud Target Systems | <Target system> | Groups** (non role-based login).
   - OR -
   In Manager, select **Entitlements | Cloud groups** (role-based login).
2. In the result list, select the group.
3. Select **Add to IT Shop**.
4. In **Add assignments**, assign the group to the IT Shop shelves.

5. Save the changes.

**To remove a group from individual shelves of the IT Shop**

1. In Manager, select **Cloud Target Systems | <Target system> | Groups** (non role-based login).
   - OR -
   In Manager, select **Entitlements | Cloud groups** (role-based login).
2. In the result list, select the group.
3. Select **Add to IT Shop**.
4. In **Remove assignments**, remove the group from the IT Shop shelves.
5. Save the changes.

**To remove a group from all shelves of the IT Shop**

1. In Manager, select **Cloud Target Systems | <Target system> | Groups** (non role-based login).
   - OR -
   In Manager, select **Entitlements | Cloud groups** (role-based login).
2. In the result list, select the group.
3. Select **Remove from all shelves (IT Shop)**.
4. Confirm the security prompt with **Yes**.
5. Click **OK**.
   The group is removed from all shelves by the One Identity Manager Service. All requests and assignment requests with are canceled.

For more detailed information about request from company resources through the IT Shop, see the **One Identity Manager IT Shop Administration Guide**.

**Additional tasks for managing groups**

After you have entered the master data, you can run the following tasks.
Overview of groups

Use this task to obtain an overview of the most important information about a group.

To obtain an overview of a group
1. Select the category Cloud Target Systems | <target system> | Groups.
2. Select the group in the result list.
3. Select Group overview in the task view.

Adding groups to groups

Use this task to add a group to another group.

To assign groups directly to a group
1. In the Manager, select the category Cloud Target Systems | <target system> | Groups category.
2. Select the group in the result list.
3. Select Assign groups.
4. Assign the groups that are are subordinate to the selected group in Add assignments.
   - **TIP:** you can remove the assignment of groups in the Remove assignments area.
   - **To remove an assignment**
     - Select the group and double click ✓.
5. Save the changes.

Effectiveness of group memberships

Table 40: Configuration Parameter for Conditional Inheritance

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Effect when set</th>
</tr>
</thead>
<tbody>
<tr>
<td>QER</td>
<td>Preprocessor relevant configuration parameter for controlling effectiveness of group memberships. If the parameter is set, memberships can be reduced on the basis of exclusion definitions.</td>
</tr>
<tr>
<td>Structures</td>
<td>Inherite</td>
</tr>
</tbody>
</table>
When groups are assigned to user accounts an employee may obtain two or more groups, which are not permitted in this combination. To prevent this, you can declare mutually exclusive groups. To do this, you specify which of the two groups should apply to the user accounts if both are assigned.

It is possible to assign an excluded group directly, indirectly or by IT Shop request at any time. One Identity Manager determines whether the assignment is effective.

**NOTE:**

- You cannot define a pair of mutually exclusive groups. That means, the definition "Group A excludes group B" AND "Group B excludes groups A" is not permitted.
- You must declare each group to be excluded from a group separately. Exclusion definitions cannot be inherited.
- One Identity Manager does not check whether membership of an excluded group is permitted in another group (table CSMGroupInGroup).

The effectiveness of the assignments is mapped in the CSMUserInGroup and CSMBaseTreeHasGroup via the column XIsInEffect.

---

### Example of the effect of group memberships

- Group A is assigned through the department "Marketing", group B through "Finance" and group C through the business role "Control group".

Clara Harris has a user account in this target system. She primarily belongs to the department "marketing". The business role "Control group" and the department "Finance" are assigned to her secondarily. Without an exclusion definition, the user account obtains all the permissions of groups A, B and C.

By using suitable controls, you want to prevent an employee from being able to trigger a request and to pay invoices. That means, groups A, B and C are mutually exclusive. An employee that checks invoices may not be able to make invoice payments as well. That means, groups B and C are mutually exclusive.

### Table 41: Specifying excluded groups (table AADGroupExclusion)

<table>
<thead>
<tr>
<th>Effective Group</th>
<th>Excluded Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group A</td>
<td></td>
</tr>
<tr>
<td>Group B</td>
<td>Group A</td>
</tr>
<tr>
<td>Group C</td>
<td>Group B</td>
</tr>
</tbody>
</table>
Table 42: Effective Assignments

<table>
<thead>
<tr>
<th>Employee</th>
<th>Member in Role</th>
<th>Effective Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ben King</td>
<td>Marketing</td>
<td>Group A</td>
</tr>
<tr>
<td>Jan Bloggs</td>
<td>Marketing, finance</td>
<td>Group B</td>
</tr>
<tr>
<td>Clara Harris</td>
<td>Marketing, finance, control group</td>
<td>Group C</td>
</tr>
<tr>
<td>Jenny Basset</td>
<td>Marketing, control group</td>
<td>Group A, Group C</td>
</tr>
</tbody>
</table>

Only the group C assignment is in effect for Clara Harris. It is published in the target system. If Clara Harris leaves the business role "control group" at a later date, group B also takes effect.

The groups A and C are in effect for Jenny Basset because the groups are not defined as mutually exclusive. That means that the employee is authorized to trigger request and to check invoices. If this should not be allowed, define further exclusion for group C.

Table 43: Excluded groups and effective assignments

<table>
<thead>
<tr>
<th>Employee</th>
<th>Member in Role</th>
<th>Assigned Group</th>
<th>Excluded Group</th>
<th>Effective Group</th>
</tr>
</thead>
<tbody>
<tr>

<td>Marketing</td>
<td>Group A</td>
<td>Group C</td>
<td>Group C</td>
</tr>
<tr>
<td></td>
<td>Control group</td>
<td></td>
<td>Group B</td>
<td>Group A</td>
</tr>
</tbody>
</table>

Prerequisites

- The configuration parameter **QER | Structures | Inherit | GroupExclusion** is enabled.
- Mutually exclusive groups belong to the same cloud target system.

To exclude a group

1. In the Manager, select the category **Cloud Target Systems | <target system> | Groups** category.
2. Select a group in the result list.
3. Select **Exclude groups**.
4. Assign the groups that are mutually exclusive to the selected group in **Add assignments**.
   - OR -
In **Remove assignments**, remove the groups that are not longer mutually exclusive.

5. Save the changes.

**Group inheritance based on categories**

In One Identity Manager, groups can be selectively inherited by user accounts. For this purpose, the groups and the user accounts are divided into categories. The categories can be freely selected and are specified using a mapping rule. Each category is given a specific position within the template. The template contains two tables; the user account table and the group table. Use the user account table to specify categories for target system dependent user accounts. In the group table enter your categories for the target system-dependent groups. Each table contains the category positions **Position 1 to Position 31**.

Every user account can be assigned to one or more categories. Each group can also be assigned to one or more categories. The group is inherited by the user account when at least one user account category item matches an assigned group. The group is also inherited by the user account if the group or the user account is not put into categories.

<table>
<thead>
<tr>
<th>Category Position</th>
<th>Categories for User Accounts</th>
<th>Categories for Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Default user</td>
<td>Default entitlements</td>
</tr>
<tr>
<td>2</td>
<td>System users</td>
<td>System user entitlements</td>
</tr>
<tr>
<td>3</td>
<td>System administrator</td>
<td>System administrator entitlements</td>
</tr>
</tbody>
</table>

**NOTE:** Inheritance through categories is only taken into account when groups are assigned indirectly through hierarchical roles. Categories are not taken into account when groups are directly assigned to user accounts.
To use inheritance through categories

- Define categories in the cloud target system.
- Assign categories to user accounts through their master data.
- Assign categories to groups through their master data.

---

**Figure 2: Example of inheriting through categories.**

<table>
<thead>
<tr>
<th>User Categories</th>
<th>Permissions Categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>System administrator</td>
<td>Default permissions</td>
</tr>
<tr>
<td>System user</td>
<td>System user permissions</td>
</tr>
<tr>
<td>Default user</td>
<td>System administrator permissions</td>
</tr>
</tbody>
</table>

**Resulting Group Memberships**

<table>
<thead>
<tr>
<th>Group A</th>
<th>Group B</th>
<th>Group C</th>
<th>Group D</th>
<th>Group E</th>
</tr>
</thead>
<tbody>
<tr>
<td>User A</td>
<td>×</td>
<td>×</td>
<td>×</td>
<td>×</td>
</tr>
<tr>
<td>User B</td>
<td>○</td>
<td>×</td>
<td>×</td>
<td>×</td>
</tr>
<tr>
<td>User C</td>
<td>○</td>
<td>×</td>
<td>×</td>
<td>×</td>
</tr>
<tr>
<td>User D</td>
<td>○</td>
<td>×</td>
<td>×</td>
<td>×</td>
</tr>
<tr>
<td>User E</td>
<td>○</td>
<td>×</td>
<td>×</td>
<td>×</td>
</tr>
</tbody>
</table>

**Key:**
- Inherit due to matching categories
- Inherit because user account is not categorized
- Inherit because group is not categorized

Assigning permissions controls

Use this task to assign permissions controls to groups.

To assign permissions controls to a group
1. Select the category Cloud Target Systems | <target system> | Groups.
2. Select the group in the result list.
3. Select Assign permissions controls.
4. Double-click on the permission controls you want to assign in Add assignments.
   - OR -
   In the Remove assignments view, double-click on the permissions controls for which you want to delete the assignment.
5. Save the changes.

Related topics
- Cloud permissions controls on page 118

Assigning extended properties

Extended properties are meta objects that cannot be mapped directly in One Identity Manager, for example, operating codes, cost codes or cost accounting areas.

To specify extended properties for a group
1. Select the category Cloud Target Systems | <target system> | Groups.
2. Select the group in the result list.
3. Select Assign extended properties in the task view.
4. Assign extended properties in Add assignments.
   - OR -
   Remove extended properties from Remove assignments.
5. Save the changes.
For more detailed information about setting up extended properties, see the One Identity Manager Identity Management Base Module Administration Guide.

Deleting groups

To delete a group

1. Select the category Cloud Target Systems | <target system> | Groups.
2. Select the group in the result list.
3. Click to delete the group.
4. Confirm the security prompt with Yes.

This deletes the group completely from the One Identity Manager database. Once you have deleted a group, it is also deleted in the Universal Cloud Interface Module through the provisioning process and then in the cloud application. The deletion is logged as a pending change. You can see whether the group has been deleted in the cloud application from the process status for the pending change. The same applies if memberships of user accounts in groups are deleted.

Related topics

- Provisioning object changes on page 122
Cloud permissions controls

Use permissions controls to map more of the cloud application's properties.

To edit permissions controls

1. Select the category Cloud Target Systems | <target system> | Permissions controls.
2. Select the permissions control in the result list. Select Change master data.
   - OR -
   Click 📝 in the result list.
3. Edit the permissions controls’ master data.
4. Save the changes.

Detailed information about this topic

- General master data for permissions controls on page 118
- User-defined master data for permissions controls on page 119

General master data for permissions controls

Enter the following master data for a permissions control.

Table 45: Permissions Control Master Data

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target system</td>
<td>Cloud target system in which the permissions control applies.</td>
</tr>
<tr>
<td>Permissions control</td>
<td>Name of the permissions control.</td>
</tr>
<tr>
<td>Access type</td>
<td>Additional permissions control properties.</td>
</tr>
<tr>
<td>Description</td>
<td>Spare text box for additional explanation.</td>
</tr>
</tbody>
</table>
User-defined master data for permissions controls

You can find customized data for a permissions control on the Custom tab.

Table 46: User-defined master data for permissions controls

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Spare field 01 - spare field 05</td>
<td>Additional company specific information. Use Designer to customize display names, formats and templates for the input fields.</td>
</tr>
<tr>
<td>Spare date 01 - spare date 03</td>
<td>Additional company specific information. Use Designer to customize display names, formats and templates for the input fields.</td>
</tr>
<tr>
<td>Spare text 01 - spare text 05</td>
<td>Additional company specific information. Use Designer to customize display names, formats and templates for the input fields.</td>
</tr>
<tr>
<td>Spare option 01 - spare option 05</td>
<td>Additional company specific information. Use Designer to customize display names, formats and templates for the input fields.</td>
</tr>
</tbody>
</table>

Additional tasks for permissions controls

After you have entered the master data, you can run the following tasks.

Permissions control overview

You can see the most important information about a permissions control on the overview form.

To obtain an overview of a permissions control

1. Select the category Cloud Target Systems | <target system> | Permissions controls.
2. Select the permissions control in the result list.
3. Select Permissions control overview in the task view.
Assigning permissions controls to user accounts

Use this task to assign a permissions control directly to user accounts.

**To assign permissions controls to user accounts**

1. Select the category Cloud Target Systems | <target system> | Permissions controls.
2. Select the permissions control in the result list.
3. Select Assign user accounts in the task view.
4. Assign user accounts in Add assignments.
   
   **TIP:** In the Remove assignments area, you can remove the assignment of user accounts.
   
   **To remove an assignment**
   - Select the user account and double click.

5. Save the changes.

Assigning permissions controls to groups

Use this task to assign a permissions control directly to groups.

**To assign permissions controls to groups**

1. Select the category Cloud Target Systems | <target system> | Permissions controls.
2. Select the permissions control in the result list.
3. Select Assign groups in the task view.
4. Assign groups in Add assignments.
   
   **TIP:** you can remove the assignment of groups in the Remove assignments area.
   
   **To remove an assignment**
   - Select the group and double click.

5. Save the changes.
Deleting permissions controls

To delete a permissions control

1. Select the category **Cloud Target Systems | <target system> | Permissions controls**.
2. Select the permissions control in the result list.
3. Click to delete the permissions control.
4. Confirm the security prompt with **Yes**.

This deletes the permissions control completely from the One Identity Manager database. Once you have deleted a permissions control, it is also deleted in the Universal Cloud Interface Module through the provisioning process and then in the cloud application. The deletion is logged as a pending change. You can see whether the permissions control has been deleted in the cloud application from the process status for the pending change. The same applies if permissions control assignments to user accounts or groups are deleted.

Related topics

- **Provisioning object changes** on page 122
Provisioning object changes

Changes to cloud objects can only be made in the Cloud Systems Management Module. Provisioning processes ensure that object changes are transferred from the Cloud Systems Management Module into the Universal Cloud Interface Module. By default, these object changes are then published in the cloud application by automatic provisioning processes.

The One Identity Manager logs the object changes as pending changes in separate tables. The table QBMPendingChange contains the modified objects and their processing status. The details of the changes, operations to execute, time stamp and processing status are saved in the QBMPendingChangeDetail.

The processing status of an object is not set to successful until all associated changes for this object have been successfully provisioned. An object’s processing status is set as failed if all associated changes have been processed and at least one them has failed.

Detailed information about this topic

- The provisioning sequence on page 122
- Retention time for pending changes on page 124

The provisioning sequence

The following image show how object changes are provisioned and how the pending changes associated with it are processed. The sequence does no depend on whether the module Cloud System Management and the Universal Cloud Interface are installed in the same or in separate databases.
By default, the Cloud Systems Management module is synchronized hourly with the Universal Cloud Interface. This ensures that the processing state for pending changes is declared promptly in the Cloud Systems Management Module.

**Displaying pending changes**

You can view pending changes in the Manager. Here, manual and automatic provisioning processes are shown.

*To display pending changes*

- Select the menu item **Database | Pending changes**.

**Table 47: Meaning of the Icons in the Toolbar**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>🚭</td>
<td>Show selected object.</td>
</tr>
<tr>
<td>🔄</td>
<td>Reload the data.</td>
</tr>
</tbody>
</table>
Retention time for pending changes

Table 48: Configuration parameters

<table>
<thead>
<tr>
<th>Configuration parameter</th>
<th>Effect when set</th>
</tr>
</thead>
<tbody>
<tr>
<td>QBM\PendingChange\LifeTimeError</td>
<td>This configuration parameter specifies the maximum retention period (in days) for failed provisioning processes. Default is 30 days.</td>
</tr>
<tr>
<td>QBM\PendingChange\LifeTimeRunning</td>
<td>This configuration parameter specifies the maximum retention period (in days) for open provisioning processes. Default is 60 days.</td>
</tr>
<tr>
<td>QBM\PendingChange\LifeTimeSuccess</td>
<td>This configuration parameter specifies the maximum retention period (in days) for successful provisioning processes. Default is 2 days.</td>
</tr>
</tbody>
</table>

Pending changes are saved for a fixed period. After this period has expired, the entries are deleted by the DBQueue Processor from the tables QBMPendingChange and QBMPendingChangeDetail. The retention period depends on the status of provisioning processes and can be configured in the configuration parameter.

To configure the retention period for pending changes

1. To change the retention period for successful provisioning processes, edit the value of the configuration parameter "QBM\PendingChange\LifeTimeSuccess" in the Designer.
2. To change the retention period for failed provisioning processes, edit the value of the configuration parameter "QBM\PendingChange\LifeTimeError" in the Designer.
3. To change the retention period for open provisioning processes, edit the value of the configuration parameter "QBM\PendingChange\LifeTimeRunning" in the Designer.
4. Enter a retention period in days.
Reports about objects in cloud target systems

One Identity Manager makes various reports available containing information about the selected base object and its relations to other One Identity Manager database objects. The following reports are available for cloud systems.

NOTE: Other sections may be available depending on the which modules are installed.

Table 49: Reports for the Target System

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overview of all Assignments (Cloud target system)</td>
<td>This report finds all roles containing employees with at least one user account in the selected target system.</td>
</tr>
</tbody>
</table>
### Report

</tr>
</tbody>
</table>

### Related topics

- Overview of all assignments on page 126

### Overview of all assignments

The **Overview of all assignments** report is displayed for some objects, such as authorizations, compliance rules, or roles. The report finds all the roles, for example, departments, cost centers, locations, business roles and IT Shop structures in which there are employee who own the selected base object. In this case, direct as well as indirect base object assignments are included.

### Examples

- If the report is created for a resource, all roles are determined in which there are employees with this resource.
- If the report is created for a group or another system entitlement, all roles are determined in which there are employees with this group or system entitlement.
- If the report is created for a compliance rule, all roles are determined in which there are employees who violate this compliance rule.
- If the report is created for a department, all roles are determined in which employees of the selected department are also members.
- If the report is created for a business role, all roles are determined in which employees of the selected business role are also members.

### To display detailed information about assignments

- To display the report, select the base object from the navigation or the result list and select the report Overview of all assignments.
- Click the Used by button in the report toolbar to select the role class for which you want to determine whether roles exist that contain employees with the selected
base object.

All the roles of the selected role class are shown. The color coding of elements identifies the role in which there are employees with the selected base object. The meaning of the report control elements is explained in a separate legend. To access the legend, click the icon in the report's toolbar.

- Double-click a control to show all child roles belonging to the selected role.
- By clicking the button in a role's control, you display all employees in the role with the base object.
- Use the small arrow next to to start a wizard that allows you to bookmark this list of employee for tracking. This creates a new business role to which the employees are assigned.

Figure 4: Toolbar of the Overview of all assignments report.

</tr>
<tr>
<td>TargetSystem\CSM\MaxFullsyncDuration</td>
<td>This configuration parameter contains the maximum runtime for synchronization. No recalculation of group memberships by the DBQueue Processor can take place during this time. If the maximum runtime is exceeded, group membership are recalculated.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonAutoDefault</td>
<td>This configuration parameter specifies the mode for automatic employee assignment for user accounts added to the database outside synchronization.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonAutoDisabledAccounts</td>
<td>This configuration parameters specifies whether employees are automatically assigned to disable user accounts. User accounts do not obtain an account definition.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonAutoFullSync</td>
<td>This configuration parameter specifies the mode for automatic employee assignment for user accounts added to or updated in the database through synchronization.</td>
</tr>
<tr>
<td>TargetSystem\CSM\PersonExcludeList</td>
<td>List of all user accounts for which automatic employee assignment should not take place. Names are listed in a pipe (</td>
</tr>
</tbody>
</table>
Appendix: Default project template for cloud applications in the Universal Cloud Interface

A default project template ensures that all required information is added in One Identity Manager. This includes mappings, workflows and the synchronization base object. If you do not use a default project template you must declare the synchronization base object in One Identity Manager yourself.

Use a default project template for initially setting up the synchronization project. For custom implementations, you can extend the synchronization project with the Synchronization Editor.

The template uses mappings for the following schema types.

Table 52: Mapping Universal Cloud Interface schema types to tables in the One Identity Manager schema.
