Initializing and Configuring the LDAP Connector for CA Top Secret

This document describes how to initialize and configure the Top Secret LDAP connector into an existing One Identity Manager system. This enables a One Identity Manager system to access, read and update data stored in a Top Secret database on an IBM mainframe.

Detailed information about this topic

- [Pre-requisites](#) on page 4
- [Platform Support](#) on page 5
- [Operating Constraints](#) on page 5
- [How to initialize and configure the Top Secret LDAP connector](#) on page 5
- [Domain Filter Setting](#) on page 7
- [System Variables](#) on page 7
- [User Mapping Information](#) on page 8
- [Group Mapping Information](#) on page 12
- [Appendix: Top Secret Attributes](#) on page 17

Pre-requisites

- The IBM mainframe must have CA LDAP Server for z/OS installed and configured.
- An LDAP service account must be created on your Top Secret server which has the appropriate permissions to administer users and groups on this platform. The account must be given sufficient privileges so that the profiles being administered fall within the "SCOPE" of the Admin user.

NOTE: Before attempting to connect to the CA LDAP Server with the One Identity Manager connector, it is recommended to first check that the LDAP server is running correctly. This can be tested with any LDAP browser for example the LDP.exe tool from Microsoft. For more information, see your LDAP browser documentation.

Platform Support

- The Top Secret LDAP connector has been verified for synchronization against the IBM mainframe running CA Top Secret 9.0 or later.

Operating Constraints

- There is an eight character limit for user and group names on Top Secret.
- There is an eight character limit for passwords on Top Secret.

How to initialize and configure the Top Secret LDAP connector

NOTE: The following sequence describes how you configure a synchronization project if the Synchronization Editor is in expert mode.

To set up initial synchronization project for Top Secret

1. Start the Synchronization Editor and log in.
2. From the start page, select **Start a new synchronization project**.
This starts the Synchronization Editor's project wizard.
3. Select **Top Secret LDAP Connector** on the **Choose target system** page.
4. On the **System access** page, click **Next**.
5. On the **Create system connection** page, select **Create new system connection**.
6. On the system connection wizard start page, click **Next**.
7. On the **Network** page:
 - a. In the **Server** field, enter the DNS name or IP address of your mainframe server.
 - b. In the **Port** field, enter the port number.
 - c. Click on the **Test** button to make sure the server is accessible.
 - d. CA LDAP Server for z/OS supports LDAP v3. Enter the number 3 in the **Protocol version**.
 - e. If SSL is to be used, check the **Use SSL** box.

8. On the **Authentication** page:
 - a. Set the **Authentication method** to "Basic".
 - b. In the **Credentials** section, enter the full DN and password of the administrator account on your Top Secret system.
 - c. Click **Test** to check that the credentials are valid.
9. The schema will be loaded from the Top Secret system.
10. Ignore the **Define virtual classes** page. Click **Next**.
11. On the **Search options** page:
 - a. In the **Base DN** drop-down list, select the correct base DN for your system.
 - b. Ignore the **Use partitioned search** check box.
12. Ignore the **Modification capabilities** page. Click **Next**.
13. Ignore the **Auxiliary class assignment** page. Click **Next**.
14. On the **System attributes** page, in the **Revision properties** section, deselect the "createTimestamp" and "modifyTimestamp" entries by double clicking on them.
15. Ignore the **Select dynamic group attributes** page. Click **Next**.
16. Ignore the **Password settings** page. Click **Next**.
17. Click **Finish**.

This takes you back to the Synchronization Editor's project wizard.
18. Enter the database connection data on the **One Identity Manager connection** page.
19. This will load the Top Secret schema into your One Identity Manager system. Wait for this to complete.
20. On the **Select project template** page, select **Create blank project**.
21. On the **General** page, enter a display name for your synchronization project and set a scripting language if required.
22. Click **Finish** to complete the project wizard.
23. Select **Activate project** to activate the project.

System Variables

The following system variables need to be defined for the attribute mappings. For more detailed information about variables, see the One Identity Manager Target System Synchronization Reference Guide.

Table 1: System variables

Name	Value
IdentDomain	The name of your Top Secret domain e.g. TOPSECRET1
UserLocation	Parent DN of your Top Secret user container, e.g. tssad-mingrp=acids,host=topsecret1,o=mycompany,c=com
GroupLocation	Parent DN of your Top Secret group container, e.g. tssad-mingrp=groups,host=topsecret1,o=mycompany,c=com

Related Topics

- [Domain Filter Setting](#) on page 7
- [Property Mapping Rules](#) on page 9
- [Property Mapping Rules](#) on page 13

Domain Filter Setting

A domain filter needs to be created to identify information that has been retrieved from the Top Secret database to keep it separate from other imported data.

1. Update the One Identity Manager schema so that all entries are included.
 - a. In the Synchronization Editor, open your Top Secret project.
 - b. Select the category **Configuration | One Identity Manager connection**.
 - c. Then in the "General" section on the right-hand side, click **Update schema**.
 - d. Click on **Yes** in the next two dialog boxes.
 - e. Click **Ok** when completed.
2. In the Manager
 - a. Select the category **LDAP | Domains**.
 - b. In the result list toolbar, click .

- c. Enter at least the following general master data on the **General** tab.

Table 2: Domain Master Data

Property	Description
Display name	Display name e.g. Top Secret Domain
Distinguished name	Distinguished name of the domain e.g. host=topsecret1, - ,o=mycompany,c=com
Domain	Domain name e.g. TOPSECRET1
Structural object class	Structural object class representing the object type, enter DCOBJECT

- d. Save the changes.
3. In the Synchronization Editor, open your Top Secret project.
 - a. Select the category **Configuration | One Identity Manager connection**.
 - b. Select the **Scope view** and click **Edit scope**.
 - c. Select the object type LDPDomain in the **Scope hierarchy** list and set the **Object filter** to: Ident_Domain ='\$IdentDomain\$'.
 - d. Save the changes.

For more detailed information about scopes, see the One Identity Manager Target System Synchronization Reference Guide.

User Mapping Information

This section shows a possible mapping between a user account in Top Secret and the standard One Identity Manager database table called LDAPAccount.

- Set up a new mapping from LDAPAccount(a11) to tssacid(a11).

For more detailed information about setting up mappings, see the One Identity Manager Target System Synchronization Reference Guide.

Detailed information about this topic

- [Mandatory Top Secret User Attributes](#) on page 9
- [Property Mapping Rules](#) on page 9
- [Object Matching Rules](#) on page 11

Mandatory Top Secret User Attributes

When creating a user in the Top Secret database, the following LDAP attributes must be defined:

- objectclass
- tssacid
- name
- Department
- userPassword

Related Topics

- [Property Mapping Rules](#) on page 9
- [Object Matching Rules](#) on page 11

Property Mapping Rules

- CanonicalName ← vrtEntryCanonicalName
vrtEntryCanonicalName is a virtual property, set to the canonical name of the object in the connector.
Sample value:
COM/MYCOMPANY/TOPSECRET1/ACIDS/USER1234
- cn ←→ tssacid
On the Top Secret system, tssacid is the user ID.
Sample value:
USER1234
- DistinguishedName ← vrtEntryDN
vrtEntryDN is a virtual property, set to the DN of the object in the connector. Once this mapping rule has been created, edit the mapping rule by clicking on it. Then check the box marked **Force mapping against direction of synchronization**.
Sample value:
tssacid=USER1234,tssadmingrp=acids,host=topsecret1,o=mycompany,c=com
- ObjectClass ←→ objectClass
The objectClass attribute (multi-valued) on the Top Secret system. Activate the check box **Ignore case sensitivity**.
Sample value:
TSSACID

- StructuralObjectClass ← vrtStructuralObjectClass

vrtStructuralObjectClass on the Top Secret system defines the single object class for the object type.

Sample value:

TSSACID

- UID_LDPPDomain ← vrtIdentDomain

Create a fixed value property variable on the Top Secret side called vrtIdentDomain that is set to the value \$IdentDomain\$. Map this to UID_LDPPDomain. This will cause a conflict and the Property Mapping Rule Conflict Wizard opens automatically.

To solve the conflict

1. In the Property Mapping Rule Conflict Wizard, select the first option and click **OK**.
2. On the **Select an element...** page, select **Ident_Domain** and click **OK**.
3. Confirm the security prompt with **OK**.
4. On the Edit property... page,
 - a. Deactivate **Save unresolvable keys**.
 - b. Activate **Handle failure to resolve as error**.
 - c. To close the Property Mapping Rule Conflict Wizard, click **OK**.

Sample value:

TOPSECRET1

- vrtParentDN → vrtEntryParentDN

Create a fixed value property variable on the One Identity Manager side called vrtParentDN equal to a fixed string with value \$UserLocation\$. Map this to vrtEntryParentDN on the Top Secret side.

Sample value:

tssadmingrp=acids,host=topsecret1,o=mycompany,c=com

- vrtDep → Department

Create a new fixed value property on the One Identity Manager side of type "String" with the name of your department. Call the property vrtDept. Map this to Department on the Top Secret side.

- vrtName → name

Create a new variable on the One Identity Manager side of type "Format Defined Property" with name vrtName. Set its value to name=%CN%. Then map this to name on the Top Secret side.

Sample value:

name=USER123

- vrtRDN → vrtEntryRDN

Create a new variable on the One Identity Manager side of type "Format Defined Property" with name vrtRDN. Set its value to %CN%. Then map this to vrtEntryRDN on the Top Secret side.

Sample value:

USER123

- userPassword → userPassword

Used to change a user's password in Top Secret. A condition needs to be set on this rule to map the password only when there is a value to be copied.

To add a condition

1. Create the mapping.
2. Edit the property mapping rule.
3. Expand the **Condition for execution** section at the bottom of the dialog.
4. Click on **Add condition** and set the following condition (a blank password is indicated by using two apostrophe characters).

```
Left.UserPassword<>' '
```

- UID_LDAPContainer ← vrtEmpty

This is a workaround needed to support group mappings. Create a new fixed value variable on the TopSecret side of type "String" with no value called vrtEmpty. Map this to UID_LDAPContainer. This generates a property mapping rule conflict.

To solve the conflict

- In the Property Mapping Rule Conflict Wizard, highlight **Select this option if you do not want to change anything** and click **OK**.

Related Topics

- [Mandatory Top Secret User Attributes](#) on page 9
- [System Variables](#) on page 7
- [Object Matching Rules](#) on page 11
- Sample User Mapping

Object Matching Rules

- DistinguishedName (primary rule) vrtEntryDN

vrtEntryDN is a virtual property, set to the DN of the object in the connector. This forms a unique ID to distinguish individual user objects on the Top Secret system.

To convert this mapping into an object matching rule

1. Select the property mapping rule in the rule window.
2. Click  in the rule view toolbar.
A message appears.
3. Click **Yes** to convert the property mapping rule into an object matching rule and save a copy of the property mapping rule. Do not mark this rule as case sensitive (leave the check box unchecked).

Sample value:

```
tssacid=USER1234,tssadmingrp=acids,host=topsecret1,o=mycompany,c=com
```

Group Mapping Information

This section shows a possible mapping between a user account in Top Secret and the standard One Identity Manager database table called LDAPGroup.

- Set up a new mapping from LDAPGroup(all) to tssgroup(all).

For more detailed information about setting up mappings, see the One Identity Manager Target System Synchronization Reference Guide.

Detailed information about this topic

- [Mandatory Top Secret Group Attributes](#) on page 12
- [Property Mapping Rules](#) on page 13
- [Object Matching Rules](#) on page 15

Mandatory Top Secret Group Attributes

When creating a group in the Top Secret database, the following LDAP attributes must be defined:

- objectclass
- tssgroup
- name

- Department
- User-Type

Related Topics

- [Property Mapping Rules](#) on page 13
- [Object Matching Rules](#) on page 15

Property Mapping Rules

- CanonicalName ← vrtEntryCanonicalName
vrtEntryCanonicalName is a virtual property, set to the canonical name of the object in the connector.
Sample value:
COM/MYCOMPANY/TOPSECRET1/GROUPS/GROUP123
- cn ←→ tssgroup
On the Top Secret system, tssgroup is the group ID.
Sample value:
GROUP123
- DistinguishedName ← vrtEntryDN
vrtEntryDN is a virtual property, set to the DN of the object in the connector.
Sample value:
tssgroup=GROUP123,tssadmingrp=groups,host=topsecret1,o=mycompany,c=com
- ObjectClass ←→ objectClass
The objectClass attribute (multi-valued) on the Top Secret system. Activate the check box **Ignore case sensitivity**.
Sample value:
TSSGROUP
- StructuralObjectClass ← vrtStructuralObjectClass
vrtStructuralObjectClass on the Top Secret system defines the single object class for the object type.
Sample value:
TSSGROUP
- UID_LDAPDomain ← vrtIdentDomain
Create a fixed value property variable on the Top Secret side called vrtIdentDomain that is set to the value \$IdentDomain\$. Map this to UID_LDAPDomain. This will cause a conflict and the Property Mapping Rule Conflict Wizard opens automatically.

To solve the conflict

1. In the Property Mapping Rule Conflict Wizard, select the first option and click **OK**.
2. On the **Select an element...** page, select **Ident_Domain** and click **OK**.
3. Confirm the security prompt with **OK**.
4. On the Edit property... page,
 - a. Deactivate **Save unresolvable keys**.
 - b. Activate **Handle failure to resolve as error**.
 - c. To close the Property Mapping Rule Conflict Wizard, click **OK**.

Sample value:

TOPSECRET1

- vrtParentDN → vrtEntryParentDN

Create a virtual attribute on the One Identity Manager side equal to a fixed string representing the parent DN for the object that is being manipulated.

Sample value:

tssadmingrp=groups,host=topsecret1,o=mycompany,c=com

- vrtRDN → vrtEntryRDN

Create a new variable on the One Identity Manager side of type "Format Defined Property" with name vrtRDN. Set its value to %CN%. Then map this to vrtEntryRDN on the Top Secret side.

Sample value:

GROUP123

- vrtName → name

Create a new variable on the One Identity Manager side of type "Format Defined Property" with name vrtName. Set its value to name=%CN%. Then map this to name on the Top Secret side.

Sample value:

name=GROUP123

- UID_LDAPContainer ← vrtEmpty

This is a workaround needed to support group mappings. Create a new fixed value variable on the Top Secret side of type "String" with no value called vrtEmpty. This is mapped to UID_LDAPContainer. This generates a property mapping rule conflict.

To solve the conflict

- In the Property Mapping Rule Conflict Wizard, highlight **Select this option if you do not want to change anything** and click **OK**.
- vrtMember ↔ memberOf

This mapping is used to synchronize group membership information.

1. Create a new virtual entry on the One Identity Manager side of type "Members of M:N schema types" with name vrtMember. Activate the boxes to **Ignore case** and **Enable relative component handling**.
 2. Add the following M:N schema types:
 - a. Add an entry for LDAPAccountInLDAPGroup. Set the left box to UID_LDAPGroup and the right box to UID_LDAPAccount. Set the **Primary Key Property** to DistinguishedName.
 - b. Add an entry for LDAPGroupInLDAPGroup. Set the left box to UID_LDAPGroupChild and the right box to UID_LDAPGroupParent. Set the **Primary Key Property** to DistinguishedName.
 3. Create a new mapping rule of type "Multi-reference mapping rule". Set the rule name to "Member" and the mapping direction to "Both directions". Set the One Identity Manager schema property to vrtMember and the Top Secret schema property to memberOf.
- vrtType → User-Type
Create a new fixed value property on the One Identity Manager side of type "String" with the value GROUP. Call the property vrtType. Map this to User-Type on the Top Secret side.
 - vrtDept → Department
Create a new fixed value property on the One Identity Manager side of type "String" with the name of your department. Call the property vrtDept. Map this to Department on the Top Secret side.

Synchronizing Top Secret Group Members

The members of a Top Secret group can be found in the group attribute called `memberOf`. This is a multi-valued attribute that contains a list of all the group's members (`tssacids`). The CA LDAP Server does not allow this attribute to be updated directly, but it can be updated via the connector. When the connector receives a request to update a group's `memberOf` attribute, it performs all the necessary LDAP calls behind the scenes to perform the synchronization of the group members.

How the Connector Performs Group Member Synchronization

When the connector receives a request to update a group's `memberOf` attribute, it first performs an LDAP search to find out what the group's current `memberOf` attribute contains. It then compares this with the supplied update and creates a list of users that need to be added and / or deleted in order to perform the synchronization.

For each user to be added, the connector creates an LDAP object of type `tssacidlist` for the group that contains the new user's name. This adds the user to the group and the CA LDAP Server then automatically updates the group's `memberOf` attribute to include the new user.

Similarly, for each user to be deleted, the connector removes the LDAP object of type `tssacidlist` for the group associated with the user to be deleted. This removes the user from the group and the CA LDAP Server then automatically updates the group's `memberOf` attribute to remove the user.

Once all this has been done, the `memberOf` attribute for the group will then match the value that was passed in to the connector, effectively synchronizing the two values. This approach has been used in the sample group mapping that appears in this document.

One Identity solutions eliminate the complexities and time-consuming processes often required to govern identities, manage privileged accounts and control access. Our solutions enhance business agility while addressing your IAM challenges with on-premises, cloud and hybrid environments.

Contacting us

For sales or other inquiries, such as licensing, support, and renewals, visit <https://www.oneidentity.com/company/contact-us.aspx> or call +1-800-306-9329.

Technical support resources

Technical support is available to One Identity customers with a valid maintenance contract and customers who have trial versions. You can access the Support Portal at <https://support.oneidentity.com/>.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to videos at www.YouTube.com/OneIdentity
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
