Understanding product versions

This guide provides instructions on how to upgrade to the latest version of the Management Server and Agent Manager for use with Foglight® Evolve.

This guide also provides upgrade instructions for the cartridges and cartridge-related components that are included with Foglight Evolve 6.0.0. The Management Server and the Agent Manager have been updated to version 5.9.8 for this release.

This section provides information on product version numbers as well as components and cartridge compatibility:

- [Important changes in Foglight Evolve 6.0.0](#)
- [Supported upgrade path](#)
- [Foglight Evolve versions](#)

Important changes in Foglight Evolve 6.0.0

This section provides information about changes made in this release and pre-announcements of changes planned for future releases:

- Most components delivered with this Foglight Evolve release have been updated. For details, see [Component versions](#).
- Foglight Evolve introduced FIPS Compliance mode starting from 9.2. Once the FIPS Compliance mode is enabled or disabled during installation, you cannot change it without a complete re-installation of Foglight Evolve. You cannot upgrade to a FIPS-compliant Foglight from a non-FIPS compliant Foglight, and vice versa.

Supported upgrade path

Foglight Evolve 6.0.0 supports upgrading from Foglight Evolve and Foglight for Virtualization, Enterprise Edition.

Foglight Evolve 6.0.0 may be directly upgraded from Foglight Evolve 9.0, 9.1, 9.2, and 9.3, and Foglight for Virtualization, Enterprise Edition version 8.8, 8.8.5, 8.9, 8.9.1, 8.9.2, and 8.9.3. To upgrade from Foglight for Virtualization, Enterprise Edition version 8.7.5, 8.7, and 8.6, you must first upgrade the virtual appliance to version 8.8, then to version 6.0.0. For more information, see [Upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition or a previous version of Foglight Evolve](#).

Foglight Evolve versions

Foglight Evolve consists of these key software components:

- Management Server

- Agent Manager
- Cartridges

Each of these components are versioned independently. For details, see [Component versions](#).

The version number of the Foglight Evolve release does not correspond to the version number of the Management Server. To view the version of your Management Server, click **About** in the lower right corner of the browser interface.

Component versions

The upgrade process automatically updates your product components to the following version numbers:

- Management Server, version 6.0.0

i | **NOTE:** Foglight for Infrastructure 6.0.0 is embedded with the Management Server.

- Agent Manager, version 6.0.0
- Foglight for Action Packs, version 5.6.3.8
- Foglight Automation, version 5.6.3.8
- Foglight Capacity Director, version 6.0.0
- Foglight Change Analyzer, version 6.0.0
- Foglight for Hyper-V, version 6.0.0
- Foglight for Perspectives, version 5.8.3
- Foglight Resource Optimizer, version 6.0.0

i | **NOTE:** Foglight Resource Optimizer provides recommendations for changes in the VMware® or Hyper-V® environments, to make more efficient the use of resources. This requires that the VMware or Hyper-V agent is configured with a user that has elevated privileges, beyond the read-only privileges required for monitoring. For a list of privileges required for the VMware or Hyper-V agent, refer to section “Configuring Monitoring Agents for Data Collection” in the *Foglight for VMware User and Reference Guide* and *Foglight for Hyper-V User and Reference Guide*, respectively.

- Foglight for Storage Management cartridge, version 6.0.0
- Foglight for VMware, version 6.0.0

i | **NOTE:** Java 7 or later requires that the vCenter Certificate’s public key length must be 1024-bits or higher and should not use MD5. If you try to add a vCenter for monitoring, and these requirements are not met, the server generates a Certificate error and cannot add the vCenter. The vCenter server Certificate should be updated to 1024-bits or higher and no MD5, to be able to add it for monitoring. For more information, see the *Foglight for VMware 6.0.0 Release Notes*.

- Foglight for VMware Horizon View, version 6.0.0
- Foglight for vCloud Director, version 6.0.0
- Foglight for Citrix XenDesktop and XenApp, version 6.0.0
- Foglight Hybrid Cloud Manager, version 6.0.0
- Quest Protect Dashboard, version 6.0.0
- Foglight Cost Director, version 6.0.0
- Foglight for NetVault, version 6.0.0
- Foglight for Container Management, version 6.0.0

- Foglight for Cloud Migration, version 6.0.0
- Foglight for Apache, version 5.9.1
- Foglight Net Monitor, version 5.9.8
- Foglight Web Monitor, version 5.9.7
- Foglight for Active Directory, version 6.0.0
- Foglight for Exchange, version 6.0.0
- Foglight for Office365, version 6.0.0

For a complete list of fixes for any of these components, refer to the release notes that accompany them. If you decide to maintain the version you have of any of the updated components, as opposed to upgrading, you will not acquire the new fixes for that component.

Upgrading to Foglight Evolve

Depending on the products you already have installed, the upgrade path to Foglight Evolve may differ. Refer to the applicable set of instructions for your existing product:

- [Upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition or a previous version of Foglight Evolve](#)
- [Upgrading cartridges in a Federated Server environment](#)

Upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition or a previous version of Foglight Evolve

This section guides you through the process of upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition or a previous version of Foglight Evolve.

A typical Foglight Evolve installation includes a Management Server, at least one Foglight database, a number of cartridges installed on the server, and usually just one installation of the Agent Manager. There may also be customizations to the server in the form of custom cartridges.

The upgrade process updates each of these components to the latest version of Foglight Evolve, automatically:

- [Preparing to upgrade Foglight Evolve](#)
- [Upgrading Foglight Evolve](#)

When upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition, the license that is provided to the existing users must be updated:

- [Upgrading Foglight Evolve License](#)

Some deployed agents may need to be manually updated - for more information see:

- [Upgrading the Agent Manager](#)
- [Upgrading Foglight Evolve agents](#)

Preparing to upgrade Foglight Evolve

i | **NOTE:** Upgrades from Foglight for Virtualization Enterprise (FVE) edition to Foglight Evolve edition are not automatically free. To take advantage of the changed licensing and new functionality in Foglight Evolve, contact your Quest Account Manager to review your requirements.

Preparing for a Foglight Evolve upgrade from Foglight for Virtualization, Enterprise Edition or a previous version of Foglight Evolve is straightforward, but may be time-consuming. Before upgrading you should:

- 1 Create a support bundle from your Management Server. For information on how to do this, see the topic “Managing Support Bundles” in the *Administration and Configuration Guide*.
- 2 Back up the file system in which Foglight for Virtualization, Enterprise Edition or Foglight Evolve is installed. For information on how to do this, see the topic “Backing up Foglight” in the *Administration and Configuration Help*.
- 3 Back up your database. For information on how to do this, see the topic “Backing up Foglight” in the *Administration and Configuration Help*.

i | IMPORTANT: If you are using Oracle® RAC, back up the oracle-ds.xml file (or any other database connection files) before performing the upgrade.

- 4 Deactivate all agents through the Agent Status dashboard (**Dashboards > Administration > Agents > Agent Status**).
- 5 If you are upgrading to the Agent Manager-based VMware Performance Agent, identify the machine that will run the agent.

Recommended operating systems:

- 64-bit Windows® Server 2012 R2, with 4 GB or more RAM
- 64-bit Linux®, with 4 GB or more RAM

If you are currently running the VMware Performance Agent on a 64-bit Management Server, you can use the embedded Agent Manager for the VMware Agent to monitor up to 500 total VMs.

Note for installations monitoring large VMware environments

Some installations monitoring large VMware® environments have customized the VMware agent memory settings. These settings must be reapplied because the upgrade procedure overwrites them with the default settings.

For each Agent Host with existing VMware Performance agents:

- 1 On the agent machine, open the *baseline.jvmargs.config* file for editing. The file is located in the `<Agent_Manager_home>/state/default/config` directory.
- 2 Make note of the `vmparameter.x` values.
If the values on your agent are different, they must be reapplied after the upgrade.
- 3 After upgrading and reapplying the values in the *baseline.jvmargs.config* file, remove the deployed negotiation configuration settings directory (`<Agent_Manager_home>/state/default/config/deployments`), and restart the Agent Manager.

The new settings take effect after the Agent Manager is restarted.

Upgrading Foglight Evolve

The Foglight Evolve components (Management Server, Embedded Agent Manager, Cartridges) are all upgraded automatically by the Foglight Evolve installer.

To upgrade Foglight Evolve from Foglight for Virtualization, Enterprise Edition or a previous version of Foglight Evolve:

- 1 Download the Foglight Evolve installation package for your platform from the Support Portal.
- 2 Manually shut down your Foglight Management Server. Do not depend on the installer to shut down your running Management Server and/or embedded database, due to the timing problem. Ensure that the Management Server has stopped running before launching the Foglight Evolve installer. To verify that all Management Server processes have stopped, type the following command:

Windows®:

```
tasklist /v | find "fms"
```

Linux®:

```
ps -C fms
```

i | IMPORTANT: If your Management Server uses an external database, do not stop the database. It is important that it continue to run during the upgrade.

- 3 For extra reliability, you must back up the Foglight database, as recommended in the *Administration and Configuration Help*.
- 4 Upgrade the existing Foglight for Virtualization, Enterprise Edition or Foglight Evolve installation using the appropriate installer. Follow the on-screen instructions in the installation wizard.

i | IMPORTANT: If you have previously installed Foglight for Virtualization, Enterprise Edition or Foglight Evolve in a custom location, select the Custom Install option. You must specify the same installation directory as used for the existing installation.

- 5 The installer detects the earlier version of Foglight for Virtualization, Enterprise Edition or Foglight Evolve.
- 6 Follow the on-screen upgrade instructions.

Select **Upgrade** and click **Next**.

- 7 The upgrade process continues in a similar fashion to the installation. For step-by-step assistance, refer to the appropriate *Foglight Installation and Setup Guide* for the database and platform you are running.

i | NOTE: The database upgrade may be time consuming if you have a large topology.

- 8 After the Foglight Evolve application is upgraded, the licensed cartridges are upgraded automatically.

i | NOTE: When upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition, the license that is provided to the existing users must be updated.

Upgrading Foglight Evolve License

After upgrading Foglight Evolve from Foglight for Virtualization, Enterprise Edition, the license must be updated. To update the product license, do the following:

- 1 Install the Foglight Evolve Core License. Refer to *Install licenses* in *Foglight Administration and Configuration Guide* for detailed information.
- 2 Install Foglight Evolve feature license, which includes Foglight Evolve Cloud, Foglight Evolve Monitor, Foglight Evolve Operate, and Foglight Evolve Flex license. Refer to *Foglight Evolve Release Notes* for detailed license matrix.
- 3 Remove old Foglight for Virtualization, Enterprise Edition license.

Upgrading the Agent Manager

Backing up custom JRE certificates before upgrading Agent Manager

When upgrading external Agent Manager, if the new Agent Manager uses a higher version JRE than the old Agent Manager, the JRE TrustStore (caserts) in the old Agent Manager will be replaced by the new TrustStore from the higher version JRE. This will cause all the custom certificates imported to the old JRE TrustStore by customers get lost after the Agent Manager upgrade.

To keep the custom certificates, you need to back up the old JRE TrustStore before upgrading external Agent Manager, by following below steps:

- 1 Verify if the new Agent Manager uses a higher version JRE than the old Agent Manager.
- 2 If yes, copy the file `<fglam_home>/jre/<current_jre_version>/jre/lib/security/cacerts` to a local directory before upgrading Agent Manager.
- 3 After Agent Manager is upgraded, replace the cacert TrustStore with the copied cacert TrustStore and restart Agent Manager.

As for the embedded Agent Manager, it uses the same JRE as the Management Server. If there are custom JRE certificates stored in JRE TrustStore and a higher JRE version is used, back up the JRE cacert TrustStore used by the Management Server before upgrading Management Server.

i | NOTE: If the new JRE TrustStore has different entries than the old JRE TrustStore, there is a risk that these entries would get lost after replacing with the old JRE TrustStore.

Below is a list of JRE versions used by Agent Manager on various platforms in this release.

Platform	JRE Version
windows-x86_64	1.8.0.222
linux-x86_64	1.8.0.222
windows-ia32	1.8.0.181
linux-ia32	1.8.0.181
solaris-sparc64	1.8.0.181
solaris-x86_64	1.8.0.181
aix-powerpc64	1.8.0.537
hpux-ia64	1.8.0.18

Upgrading the Agent Manager

The embedded Agent Manager is updated as part of the upgrade process. Any additional, external Agent Managers may need to be updated.

- 1 On the navigation panel, under **Dashboards**, click **Administration > Agents > Agent Managers**.
The Agent Managers dashboard lists all agent hosts currently connected to the Foglight Evolve server. If an agent host is not connected, start the Agent Manager process on that host.
- 2 If the **Version** of any agent host listed is not 6.0.0, continue following this procedure to upgrade the Agent Manager.
Otherwise, see the [Appendix: Deploying an agent package using the browser interface](#).
- 3 To upgrade, select the agent host from the list and click **Upgrade**. The process may take a few minutes and the agent host may disappear from the list temporarily while it is restarting.
i | NOTE: Repeat the upgrade process for every agent host that is not at version 6.0.0 or prior.
- 4 In some cases the upgraded Agent Manager may fail to restart after upgrading, and report as failed. If this happens, manually start the Agent Manager on the remote host.
i | NOTE: If you are upgrading from Management Server version 5.2.4, an Agent Manager and Guest Process agent do not yet exist. For information on how to install and configure the Agent Manager, see the *Agent Manager Guide*.

Upgrading Foglight Evolve agents

After upgrading Foglight Evolve, the database, and cartridges, the agents used by some of the cartridges must be updated to ensure proper data collection. Specifically, this section describes the procedures for upgrading monitoring agents.

Upgrading the VMware Performance agent

i **IMPORTANT:** To take advantage of all of the features in the updated VMware Performance agent, the user must be configured with sufficient privileges. On the Virtual Center server, verify that the user has the following privileges:

- Datastore > Browse datastore
- Datastore > Remove file
- Sessions > View and stop sessions
- Virtual machine > Configuration > Change CPU count
- Virtual machine > Configuration > Change resource
- Virtual machine > Configuration > Memory
- Virtual machine > Interaction > Power Off
- Virtual machine > Interaction > Power On
- Virtual machine > State > Remove Snapshot

To upgrade an Agent Manager-based VMware Performance agent:

- 1 Log in to Foglight Evolve using an account with administration-level permissions.
- 2 Deactivate all VMware Performance agents.
 - a On the navigation panel, under **Dashboards**, click **Administration > Agents > Agent Status**.
 - b On the Agent Status dashboard, select the existing VMware Performance agents and click **Deactivate**.

i | **TIP:** Use Shift+Click or Ctrl+Click to select multiple items.

- 3 Upgrade the agent package. On the VMware Environment dashboard > Administration tab, select all agent instances from the Agents table, and click **Update Agent** on the menu bar.

i **NOTE:** Alternatively, you can deploy the updated agent package (*VMware-Performance-64bit-<version>.gar*) using the browser interface; for details, see [Appendix: Deploying an agent package using the browser interface](#).

NOTE: If the VMware agent was modified to use custom memory settings as described in the [Note for installations monitoring large VMware environments](#) section, reapply those settings by editing the *baseline.jvmargs.config* file before activating the upgraded agent.

- 4 Activate all VMware Performance agents. On the VMware Environment dashboard > Administration tab, select the deactivated VMware Performance agents, and click **Activate** on the menu bar.

Upgrading the VMware Horizon View agent

Foglight for VMware Horizon View uses VMware Horizon View Agent instances to collect information from monitored hosts.

To upgrade a VMware Horizon View agent:

- 1 Install the latest version of Foglight for VMware Horizon View over the older version. Do not delete the older version of the .car file. For cartridge installation instructions, see "Installing Foglight cartridges" in the *Foglight Administration and Configuration Help*.

- 2 On the navigation panel, under **Dashboards**, click **VMware Horizon View** to open VMware View Environment dashboard.
- 3 Click the **Administration** tab.
The Agent Version column in the Agents table shows the agents that are out of date.
- 4 Click **Update Agent** once for each Foglight Agent Manager instance on which outdated VMware Horizon View agents are running.
The selected agents are updating. When the operation completes, the Agent Version column is updated to read **Version Up To Date**.
- 5 Click the **Details** tab, then the **Desktops** tile.
- 6 In the Quick View, identify whether there are any Unmanaged or Terminal Server Hosts instances.
 - i** | **NOTE:** The Summary view for any Unmanaged or Terminal Server Hosts instances would displays no data. This is due to the default properties used by the View Discovery Wizard to create Infrastructure agents, for any Unmanaged or Terminal Server Hosts.
- 7 If any Unmanaged or Terminal Server Hosts instances exist on the list, update the properties for their corresponding Infrastructure agents.
 - i** | **NOTE:** If some instances on the list do not have a corresponding Infrastructure agent, you must first create an Infrastructure agent manually, define appropriate agent properties, and create the correct credentials for them. Alternatively, you can add these instances to an existing credential's resource mapping.
 - a On the navigation panel, click **Administration > Agents > Agent Status**, to open the Agent Status dashboard.
 - b Select the Infrastructure agent that needs edits, and click **Edit Properties**.
 - c Click **Modify the private properties for this agent**.
 - d In the Properties area, set to *True* the following options: **Collect CPU metrics**, **Collect disk metrics**, **Collect memory metrics**, and **Collect network metrics**.
 - e Click **Save**.
 - f Repeat steps b to e for all other Infrastructure agents used for monitoring Unmanaged or Terminal Server Hosts.

The Infrastructure agents now start to collect CPU, disk, memory, and network metrics from the monitored hosts and the VMware View Environment dashboard will display this information correctly.

Upgrading the Hyper-V agent

Foglight for Hyper-V uses Hyper-V Agent instances to collect information from monitored hosts. Upgrading Foglight for Hyper-V on the Management Server makes an upgraded Hyper-V Agent package available for deployment.

- i** | **NOTE:** Hyper-V agents are not created automatically in Foglight for Virtualization, Enterprise Edition. If you have not previously created Hyper-V agents, there will not be any agents to upgrade.

To upgrade the Hyper-V agents:

- 1 Log in to Foglight Evolve using an account with administration-level permissions.
- 2 Deactivate all Hyper-V agents.
 - a On the navigation panel, under **Dashboards**, click **Administration > Agents > Agent Status**.
 - b On the Agent Status dashboard, select the existing Hyper-V Agent instances and click **Deactivate**.

- i** | **TIP:** Use Shift+Click or Ctrl+Click to select multiple items.

- 3 Install the latest version of Foglight for Hyper-V over the older version. Do not delete the older version of the .car file. For cartridge installation instructions, see “Installing Foglight cartridges” in the *Foglight Administration and Configuration Help*.
- 4 Upgrade the agent package. On the Hyper-V Environment dashboard > Administration tab, select all agent instances from the Agents table, and click **Update Agent** on the menu bar.

i | **TIP:** In this way, the credentials for the existing Hyper-V agents are created automatically.

i | **NOTE:** Alternatively, you can deploy the updated agent package (*HypervAgent.gar*) using the browser interface; for details, see [Appendix: Deploying an agent package using the browser interface](#). In this case, you need to create the corresponding credentials any existing Hyper-V agents manually, after deploying the agent package.

- 5 Activate all Hyper-V agents. On the Hyper-V Environment dashboard > Administration tab, select the deactivated Hyper-V agents, and click **Activate** on the menu bar.

Upgrading cartridges in a Federated Server environment

Cartridge upgrades in a Federated Management Server environment need to be handled differently than typical cartridge upgrades. To maintain the Federated topology, you must disconnect and reconnect the queries as part of the upgrade procedure.

You must also ensure that the required cartridges are being upgraded in a Federated environment. For example, you may determine the following:

- Federated Child # 1 requires upgrades to Foglight for Infrastructure and Foglight for Oracle.
- Federated Child # 2 requires upgrades to Foglight for Infrastructure and Foglight for SQL Server.

In this example, after upgrading the two Federated Children, you need to upgrade Foglight for Infrastructure, Foglight for Oracle, and Foglight for SQL Server on the Federation Master.

The procedure outlined below describes the required sequence of steps. For more information about the cartridge upgrade in the Federation environment, refer to the *Upgrade the cartridges in a federated or High Availability (HA) environment* section in the *Foglight Upgrade Guide*.

To upgrade cartridges in a Federated environment:

- 1 Disable the topology synchronization in the Federation Master by commenting out all child server URLs (the `FederationURLs` in the *federation.config* file).
- 2 Upgrade one or more cartridges on the stand-alone Management Servers (Federated Children).

i | **NOTE:** All Federated Children that need to be upgraded must be upgraded before uncommenting the URLs in the *federation.config* file.

- 3 Upgrade same cartridges on the single, central Management Server (Federation Master).
- 4 Uncomment the child server URLs in the *federation.config* file.

Upgrading the Infrastructure Management cartridges

This section explains how to upgrade an earlier version of an Infrastructure Management cartridge to the most current version. For details, refer to the following topics:

- [Upgrade Foglight for Active Directory](#)
- [Upgrade Foglight for Exchange](#)
- [Upgrade Foglight for Office 365](#)
- [QuestUpgrade Foglight for Storage Management cartridge](#)

Upgrade Foglight for Active Directory

The latest version of Foglight for Active Directory is 6.0.0. You can upgrade to version 6.0.0 of Foglight for Active Directory from 5.7.2.2 or higher.

Foglight for Active Directory 6.0.0 requires Management Server version 6.0.0.

i | **NOTE:** All original rules in each cartridge are reset when the cartridge is upgraded; therefore if you applied custom conditions to any original rules these modifications will be lost. It is recommended that when modifying rules you make a copy of the original, disable the original and enable the copy with the new condition. Use the **Rules** dashboard (**Dashboards > Administration > Rules & Notifications > Rules**) to copy a rule.

i | **IMPORTANT:** Foglight for Active Directory 6.0.0 may require more memory be allocated to the main Agent Manager instance than was previously needed. For details, see the *Foglight for Active Directory Release Notes*.

To upgrade Foglight for Active Directory to the latest version:

- 1 Create and release the lockbox.

i | **NOTE:** You can skip this step if upgrading Foglight for Active Directory from version 5.6.6 or later.

- a From the navigation panel, navigate to the **Credentials > Manage Lockboxes** dashboard.
- b Create a custom lockbox for the Active Directory® credential. In the **New Lockbox** dialog box, type *ActiveDirectory* as the lockbox name, and secure the lockbox by typing a password (optionally). If you choose to use the default lockbox (**System**), you can ignore this step.
- c In the Manage Lockboxes dashboard, release the lockbox for the newly create *ActiveDirectory* lockbox, by clicking the icon on its **Release to Credentials Clients** column. Enter the password for authorizing the operation, select the clients from the list, and click **Release**.

- 2 Deactivate all of the Active Directory agents.

- 3 Install version 6.0.0 of the cartridge as you would install a new Foglight for Active Directory. Do not delete the older version of the .car file. For cartridge installation instructions, refer to “Installing Foglight cartridges” in the *Foglight Administration and Configuration Help*.
- 4 Deploy the agent package to each Foglight Agent Manager that hosts an Active Directory agent instance and wait for the version to update.

i | **NOTE:** This may take two to three refresh cycles.

- 5 From the navigation panel, navigate to **Dashboards > Active Directory Environment > Administration** tab. In the **Agent Management** view select the Active Directory agents that you want to upgrade, and click **Upgrade Agent**.

i | **NOTE:** You can specify the lockbox when upgrading the agents. The credentials for the existing agents are updated automatically.

NOTE: You can skip this step if upgrading Foglight for Active Directory from version 5.6.6 or later.

- 6 Verify the agent properties and update the properties and collection intervals as required.
- 7 Activate the agents and start data collections.

i | **NOTE:** For a list of issues that you may encounter after upgrading the Foglight for Active Directory to version 6.0.0, and ways to troubleshoot these issues, see the *Foglight for Active Directory Release Notes*.

i | **NOTE:** If you are also running Foglight for Exchange, you must upgrade the Exchange agents as well. It is strongly recommended that you run the same version and patch level of both cartridges.

Upgrade Foglight for Exchange

The latest version of Foglight for Exchange is 6.0.0. You can upgrade to version 6.0.0 of Foglight for Exchange from version 5.7.2.2 and later.

Foglight for Exchange 6.0.0 requires Management Server version 6.0.0.

i | **NOTE:** All original rules in each cartridge are reset when the cartridge is upgraded; therefore if you applied custom conditions to any original rules these modifications will be lost. It is recommended that when modifying rules you make a copy of the original, disable the original and enable the copy with the new condition. Use the **Rules** dashboard (**Dashboards > Administration > Rules & Notifications > Rules**) to copy a rule.

i | **IMPORTANT:** Foglight for Exchange 6.0.0 may require more memory be allocated to the main Agent Manager instance than was previously needed. For details, see the *Foglight for Exchange Release Notes*.

To upgrade Foglight for Exchange to the latest version:

- 1 Create and release the lockbox.

i | **NOTE:** You can skip this step if upgrading Foglight for Exchange from version 5.6.6 or later.

- a From the navigation panel, navigate to the **Credentials > Manage Lockboxes** dashboard.
- b Create a custom lockbox for the Exchange credential. In the **New Lockbox** dialog box, type *ExchangeLockbox* as the lockbox name, and secure the lockbox by typing a password (optionally). If you choose to use the default lockbox (**System**), you can ignore this step.
- c In the Manage Lockboxes dashboard, release the lockbox for the newly create *ExchangeLockbox* lockbox, by clicking the icon on its **Release to Credentials Clients** column. Enter the password for authorizing the operation, select the clients from the list, and click **Release**.

- 2 Deactivate all of the Exchange agents.
- 3 Install version 6.0.0 of the cartridge as you would install a new Foglight for Exchange.
For detailed cartridge installation instructions, see the “Installation instructions” section in the *Foglight for Exchange Release Notes*.
- 4 Deploy the agent package to each Foglight Agent Manager that hosts an Exchange agent instance and wait for the version to update.

i | **NOTE:** This may take two to three refresh cycles.

- 5 From the navigation panel, navigate to **Dashboards > Exchange Environment > Administration** tab. In the **Agent Management** view select the Exchange agents that you want to upgrade, and click **Upgrade Agent**.

i | **NOTE:** You can specify the lockbox when upgrading the agents. The credentials for the existing agents are updated automatically.

NOTE: You can skip this step if upgrading Foglight for Exchange from version 5.6.6 or later.

- 6 Verify the agent properties and update the properties and collection intervals as required.
- 7 Activate the agents and start data collections.

i | **NOTE:** For a list of issues that you may encounter after upgrading the Foglight for Exchange to version 6.0.0, and ways to troubleshoot these issues, see the *Foglight for Exchange Release Notes*.

i | **NOTE:** If you are also running Foglight for Active Directory, you must upgrade the Active Directory agents as well. It is strongly recommended that you run the same version and patch level of both cartridges.

Upgrade Foglight for Office 365

The latest version of Foglight for Office 365 is 6.0.0. You can upgrade to version 6.0.0 of Foglight for Office 365 from Foglight for Exchange 5.7.2.2 or Foglight for Office 365 5.7.2.3 and later.

i | **NOTE:** When upgrading a stand-alone Foglight for Office 365 from a version earlier than 6.0.0, the license must be updated. Contact your Quest Account Manager for your new license.

To upgrade the Foglight for Office 365 to the latest version:

Deactivate all of the Office 365 agents.

- 1 Install version 6.0.0 of Foglight for Office 365. For details, see Installation instructions.
- 2 Deploy the agent package to each Foglight Agent Manager that hosts an Office365 agent instance and wait for the version to update.

i | **NOTE:** This may take two to three refresh cycles.

- 3 From the navigation panel, navigate to **Dashboards > Office365 > Office365 Environment > Administration** tab. In the Agents view select the Office365 agents that you want to upgrade, and click **Upgrade Agent**.

i | **NOTE:** You can specify the lockbox when upgrading the agents. The credentials for the existing agents are updated automatically.

- 4 Verify the agent properties and update the properties and collection intervals as required.
- 5 Activate the agents and start data collections.

Quest Upgrade Foglight for Storage Management cartridge

The latest version of the Foglight for Storage Management cartridge is 6.0.0.

Foglight for Storage Management cartridge 6.0.0 requires Management Server version 6.0.0 or Foglight Evolve 6.0.0. Prior to upgrading the Storage Management cartridge, you must update Foglight for VMware to version 6.0.0. For more information, see the *Foglight for VMware Release Notes*.

To upgrade Foglight for Storage Management cartridge:

- 1 Upgrade Foglight to version 6.0.0 or Foglight Evolve to version 6.0.0.
- 2 Install and enable the following cartridges, to activate their functionality. For instructions, see “Installing Foglight Cartridges” in the Foglight online help.
 - Foglight Automation, version 5.6.3.8
 - Foglight Capacity Director, version 6.0.0
 - Foglight Change Analyzer, version 6.0.0
 - Foglight for Hyper-V, version 6.0.0
 - Foglight for Infrastructure, version 6.0.0
 - Foglight Resource Optimizer, version 6.0.0

i | **NOTE:** Foglight Resource Optimizer provides recommendations for changes in the VMware® or Hyper-V® environments, to make more efficient the use of resources. This requires that the VMware or Hyper-V agent is configured with a user that has elevated privileges, beyond the read-only privileges required for monitoring. For a list of privileges required for the VMware or Hyper-V agent, refer to section “Configuring Monitoring Agents for Data Collection” in the *Foglight for VMware User and Reference Guide* and *Foglight for Hyper-V User and Reference Guide*, respectively.

- Foglight for VMware, version 6.0.0
- 3 Install and enable the following cartridges:
 - *Storage-6_0_0.car*
 - *StorageAgentSDK-1_0_4.car*
 - *PythonAgentSDK-1_0_4.car*
 - *ManagedTopologyService-1_0_3.car*
 - *SanHost-4_5_0.car* (included in *Storage-6_0_0.car*)
 - *SMISStorageAgent-6_0_0.car*
 - 4 Upgrade the Storage Management Agents from the **Storage & San > Storage Environment > Administration** dashboard, for each Agent Manager Hosts shown in the StorageAgentMaster Monitor Agents view.

i | **NOTE:** This upgrade process has changed since the previous release.

For instructions, see “Deploying Storage Agents after an Upgrade” in the *Managing Foglight for Storage Management User and Reference Guide*. The upgrade dialog will:

- a Upgrade *StorageAgentMasterMonitor.gar*.
- b Deactivate *StorageAgentMaster.gar* and remove the Windows service running on the Agent Host named FoglightStorageManagerCollector or HDCCService.
- c Deploy *StorageAgentMasterDB.gar* and create an agent.

- d Upgrade *StorageCollector.gar*.
- 5 If you have version 2.x.x Storage Collector agents that monitor Dell Compellent arrays, follow these instructions to upgrade to version 3.x.x:
- a From the Storage UI, delete the Compellent agents that were created before 3.0.0.
 - b Restart the HDCCS service (Foglight Storage Collector service).
 - c Re-create the Compellent agent with a slightly different name than it used to have.

Appendix: Deploying an agent package using the browser interface

This section explains how to deploy an agent package using the browser interface. This method is an alternative to using the command-line interface.

In Foglight, you can use the command-line interface to deploy an agent package for an upgraded cartridge, or you can use the browser interface.

Before you can deploy an agent package on a machine, you must first install the Agent Manager and the relevant agent package on that machine.

Use the Agent Managers dashboard to deploy one agent package at a time, or to deploy the agent package to multiple hosts. You can also deploy agent packages to a single host from the Agent Status page.

i | **NOTE:** On the Agent Managers dashboard, you can deploy an agent package to multiple hosts, as long as the hosts you select are running the same operating system.

Deploying an agent package through the Agent Managers dashboard

To deploy an agent package to one or more monitored hosts:

- 1 On the navigation panel, under **Dashboards**, select **Administration > Agents > Agent Managers**.
- 2 On the Agent Managers dashboard, select one or more hosts from the list.
- 3 Click **Deploy Agent Package** in the toolbar.

i | **NOTE:** In order to select the host, the Foglight Agent Manager must be up and running on the monitored host.

The **Deploy Agent Package** dialog wizard opens.

- 4 Select the agent packages that you want to deploy to the hosts you selected.

The entries that appear in the **Agent Packages** list include only those agent packages whose platform is compatible with the platform of the hosts you selected in [Step 2](#). For example, if the host runs a particular Windows OS, the list contains only the agent packages that include the agent processes that can run on that Windows OS.

i | **NOTE:** You can only deploy those agent packages whose cartridges have already been installed on the Foglight Management Server.

Optional — To see all packages that are available for deployment, including those are not compatible with the selected hosts, select **Show Packages for All Platforms**.

i | **IMPORTANT:** Do not deploy any agent packages that are not compatible with the host's platform. Deploying incompatible agent packages on top of existing compatible agent packages deletes the existing agents which can cause unpredictable results.

Click **Next**.

- 5 On the **Summary** page, review the choices you have made. Click **Finish**.

The task appears in the **Tasks** list. Use the Tasks list to follow the progress and determine the status of the task.

Deploying an agent package through the Agent Status dashboard

To deploy an agent package to a monitored host using the Agent Status dashboard:

- 1 On the navigation panel, under **Dashboards**, select **Administration > Agents > Agent Status**.
- 2 On the Agent Status dashboard, click **Deploy Agent Package** in the toolbar.
The **Deploy Agent Package** dialog wizard opens.
- 3 In the Deploy Agent Package dialog box, on the **Host Selector** page, select the monitored host to which you want to deploy the agent package.

i | **NOTE:** In order to select the host, the Foglight Agent Manager must be up and running on the monitored host.

Click **Next**.

- 4 Ensure that the agent package the you want to deploy appears on the **Agent Packages** page.

The entries that appear in the list include only those agent packages whose platform is compatible with the platform of the host you selected in [Step 3](#). For example, if the host runs a particular Windows OS, the list contains only the agent packages that include the agent processes that can run on that Windows OS.

i | **NOTE:** You can only deploy those agent packages whose cartridges have already been installed on the Foglight Management Server.

Optional — To see all packages that are available for deployment, including those are not compatible with the selected hosts, select **Show Packages for All Platforms**.

i | **IMPORTANT:** Do not deploy any agent packages that are not compatible with the host's platform. Deploying incompatible agent packages on top of existing compatible agent packages deletes the existing agents which can cause unpredictable results.

Click **Next**.

- 5 On the **Summary** page, review the choices you have made. Click **Finish**.

The task appears in the **Tasks** list. Use the Tasks list to follow the progress and determine the status of the task.

Quest creates software solutions that make the benefits of new technology real in an increasingly complex IT landscape. From database and systems management, to Active Directory and Office 365 management, and cyber security resilience, Quest helps customers solve their next IT challenge now. Around the globe, more than 130,000 companies and 95% of the Fortune 500 count on Quest to deliver proactive management and monitoring for the next enterprise initiative, find the next solution for complex Microsoft challenges and stay ahead of the next threat. Quest Software. Where next meets now. For more information, visit <https://www.quest.com/>.

Technical support resources

Technical support is available to Dell customers with a valid maintenance contract and customers who have trial versions. You can access the Dell Support Portal at <https://support.quest.com>.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request.
- View Knowledge Base articles.
- Sign up for product notifications.
- Download software and technical documentation.
- View how-to-videos.
- Engage in community discussions.
- Chat with support engineers online.
- View services to assist you with your product.
