Contacting us	11
Technical support resources	11

Preface

Welcome to syslog-ng Store Box (SSB) version 6.0 and thank you for choosing our product. This document describes the process to upgrade existing SSB installations to SSB 6.0. The main aim of this paper is to aid system administrators in planning the migration to the new version of SSB.

⚠ CAUTION:

Read the entire document thoroughly before starting the upgrade.

Upgrading to SSB 6.0 is not supported if you have SSB deployed on any of the following Pyramid hardware: SSB N1000, SSB N1000d, SSB N5000, SSB N10000. For details, see [Prerequisites and Notes](#) on page 5.

As of June 2011, the following release policy applies to syslog-ng Store Box:

- *Long Term Supported or LTS releases* (for example, SSB 5.0) are supported for 3 years after their original publication date and for 1 year after the next LTS release is published (whichever date is later). The second digit of the revisions of such releases is 0 (for example, SSB 5.0.1). Maintenance releases to LTS releases contain only bugfixes and security updates.
- *Feature releases* (for example, SSB 5.1) are supported for 6 months after their original publication date and for 2 months after succeeding Feature or LTS Release is published (whichever date is later). Feature releases contain enhancements and new features, presumably 1-3 new features per release. Only the last of the feature releases is supported (for example, when a new feature release comes out, the last one becomes unsupported).

⚠ CAUTION:

Downgrading from a feature release to an earlier (and thus unsupported) feature release, or to the previous LTS release is not supported.

Prerequisites and Notes

Upgrade path to SSB 6.0.3

Upgrading to SSB 6.0.3 is tested and supported using the following upgrade path:

- *The latest SSB 5 LTS maintenance version (for example, 5.0.3) -> SSB 6.0.3*
Always upgrade to the latest available maintenance version of SSB 5 LTS before upgrading to SSB 6.0.3.
- *The latest maintenance version of the previous feature release (in this case, SSB 5.3) -> SSB 6.0.3*

From older releases, upgrade to 5 LTS first. For details, see [How to upgrade to syslog-ng Store Box 5 LTS](#).

Unsupported since SSB version 5.3

- **Unsupported protocol:** The sslv3 protocol is unsupported. Make sure that your clients support a newer protocol (at least tlsv1.0), otherwise SSB will not be able to receive log messages from them.
- **Unsupported ciphers:** The rc4 and 3des cipher suites are unsupported. Make sure that your clients support a cipher suite that contains more secure ciphers, otherwise SSB will not be able to receive log messages from them.
- **Unsupported digest method:** The sha-0 (sha) digest method cannot be used in logstores anymore. If you have a logstore that uses this digest method, you must configure the logstore to use a different method before upgrading to SSB 5.3. Note that SSB rotates the logstore files every midnight. After changing the digest method, you must wait for the next logrotation before upgrading to SSB 5.3. For details on changing the digest method, see "[General syslog-ng settings](#)" in the [Administration Guide](#).

⚠ CAUTION:

After upgrading to SSB 5.3, you will not be able to access and search the logstore files that use the sha-0 digest method.

- The **Special > Firmware** user privilege has been removed. To upload a new firmware, the user now needs to have the **Basic Settings > System** privilege. Note

that users who had only the **Special > Firmware** privilege will not be able to login to SSB after upgrading to version 5.3. For details on managing user privileges, see ["User management and access control" in the Administration Guide](#).

- Configuration changes of syslog-ng Premium Edition peers can be displayed only for peers running syslog-ng Premium Edition 3.0-6.0.x. Peers running syslog-ng Premium Edition version 7.0.x do not send such notifications. As a result, if you are forwarding the logs of an SSB node to another SSB node, such log messages will not be available. You can check the configuration changes of SSB on the **AAA > Accounting** page.

Unsupported since SSB version 5.2

CAUTION:

SNMP destinations and SQL sources have been removed in the SSB 5.2.0 release

Do not upgrade to SSB 5.2.0 if you are currently using and want to continue to use:

- **SNMP destinations**
- **SQL sources**

These functionalities have been removed from SSB starting with version 5.2.0. Upgrading from 5 LTS and its minor versions would mean that you would have to upgrade to 5.2.0 - to continue to receive support for the product.

Staying on 5 LTS and its minor versions means that you will not have access to the HDFS destination functionality available in SSB starting with version 5.1.0, however, you will continue to get support for 3 years after the original publication date of 5 LTS (December 2017) and for 1 year after the next LTS release is published (whichever date is later).

Pyramid hardware is not supported

SSB 5 LTS is not supported on the following hardware: SSB N1000, SSB N1000d, SSB N5000, SSB N10000.

In case you have SSB deployed on other, newer hardware or you have SSB 4 LTS, those will not be affected in any way. The version policy applies to those. For details, open the [SSB product page on the Support Portal](#) and navigate to **Product Life Cycle & Policies > Product Support Policies > Software Product Support Lifecycle Policy**.

If you wish to take advantage of new features and remain supported beyond the end date of the Extended Support phase, you need to upgrade your hardware. For assistance with your hardware upgrade, [contact our Sales Team](#). For further inquiries, [contact our Support Team](#).

If you do not know the type of your hardware or when it was purchased, complete the following steps:

1. Log in to SSB.
2. Navigate to **Basic Settings > Troubleshooting > System debug**, click **COLLECT AND SAVE CURRENT SYSTEM STATE INFO**, and save the file.
3. Log in to the [support portal](#) and submit a ticket.
4. In the **Summary** field, enter Determining hardware type.
5. Upload the file you downloaded from SSB in Step 2.
6. We will check the type of your hardware and notify you.

Upgrade checklist

The following list applies to all configurations:

- The firmware of your SSB appliance is not tainted (that is, none of its files were modified locally). If the firmware is tainted, a warning is displayed on the **Basic Settings > System > Version details** page.

Upgrading is not supported if the firmware is tainted. If your firmware is tainted, [contact our Support Team](#).

- You have backed up your configuration and your data.

For more information on creating configuration and data backups, see "[Data and configuration backups](#)" in the [Administration Guide](#).

- For added safety, you have also exported the current configuration of SSB.

For detailed instructions, refer to "[Exporting the configuration of SSB](#)" in the [Administration Guide](#).

- You have a valid [support portal](#) account.

To download the required firmware files and the license, you need a valid [support portal](#) account. To create an account, navigate to the [support portal](#) and follow the instructions on screen (you will need to enter your product's asset number, which is the license number or serial number you have been provided previously).

- You have downloaded the new 6.0 license file from [support portal](#). As license files are specific to each long term release, upgrading to SSB 6.0 removes any earlier license.

- You have downloaded the latest SSB firmware file from the [Downloads page](#).

For a details about the firmware file, see "[Firmware in SSB](#)" in the [Administration Guide](#).

- You have read the Release Notes (changelog) of the firmware(s) before updating. The Release Notes might include additional instructions specific to the firmware version.

The Release Notes are available on the [syslog-ng Store Box Documentation page](#).

If you have a high availability cluster:

- You have IPMI access to the slave node. You can find detailed information on using the IPMI interface in the following documents:

For syslog-ng Store Box Appliance 3000 and 3500, see the [IPMI User's Guide](#).

- You have verified on the **Basic Settings > High Availability** page that the HA status is not degraded.
- *If you have a high availability cluster with geocustering enabled:* Perform the firmware upload steps an hour before the actual upgrade. Geocustering can introduce delays in the synchronization between the primary and the secondary node, and the secondary node might not be able to sync the new firmware from the primary node on time.

If you are upgrading SSB in a virtual environment:

- You have created a snapshot of the virtual machine before starting the upgrade process.
- You have configured and enabled console redirection (if the virtual environment allows it).

During the upgrade, SSB displays information about the progress of the upgrade and any possible problems to the console, which you can monitor with IPMI (ILOM) or console access.

We recommend that you test the upgrade process in a non-production (virtual) environment first.

Upgrading SSB requires a reboot. We strongly suggest that you perform the upgrade on the production appliance during maintenance hours only, to avoid any potential data loss.

Upgrading to SSB 6.0.3

For details on upgrading your syslog-ng Store Box (SSB) installation to 6.0.3, see the following procedures.

Upgrading an SSB cluster

Prerequisites

Make sure that you have physically connected the IPMI interface to the network and that it is properly configured. This is important because you can only power the secondary node on through the IPMI interface. For details on configuring the IPMI interface, see ["Out-of-band management of SSB" in the Administration Guide](#).

Troubleshooting

If you experience any strange behavior of the web interface, first try to reload the page by holding the SHIFT key while clicking the Reload button of your browser to remove any cached version of the page.

In the unlikely case that SSB encounters a problem during the upgrade process and cannot revert to its original state, SSB performs the following actions:

- Initializes the network interfaces using the already configured IP addresses.
- Enables SSH access to SSB, unless SSB is running in sealed mode. That way it is possible to access the logs of the upgrade process, which helps the Support Team to diagnose and solve the problem. Note that SSH access will be enabled on every active interface, even if management access has not been enabled for the interface.

In case the web interface is not available within 30 minutes of rebooting SSB, check the information displayed on the local console and [contact our Support Team](#).

One Identity solutions eliminate the complexities and time-consuming processes often required to govern identities, manage privileged accounts and control access. Our solutions enhance business agility while addressing your IAM challenges with on-premises, cloud and hybrid environments.

Contacting us

For sales and other inquiries, such as licensing, support, and renewals, visit <https://www.oneidentity.com/company/contact-us.aspx>.

Technical support resources

Technical support is available to One Identity customers with a valid maintenance contract and customers who have trial versions. You can access the Support Portal at <https://support.oneidentity.com/>.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to videos at www.YouTube.com/OneIdentity
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
