QoreStor Command Line Reference Guide
Updated - October 2021
Version - 7.1

# Contents

# Introduction to the Quest® QoreStor™ Command Line Reference Guide

This guide provides detailed information for managing Quest® QoreStor™ data backup operations by using the QoreStor command line interface (CLI).

# About the QoreStor CLI documentation

This document provides information about using the QoreStor command line interface (CLI) for managing your data backups, performing a variety of data storage operations, and using containers to meet your backup storage needs.

**NOTE:** The QoreStor CLI provides one method for managing QoreStor, with the other being the QoreStor graphical user interface (GUI). In some instances, the QoreStor CLI might provide additional features and options that are not available in the QoreStor GUI and vice versa.

# Other information you may need

The following table lists the documentation available for QoreStor. The documents listed in this table are available on the Quest support website by selecting your specific QoreStor version at:

http://support.quest.com/QoreStor

**Table 1: QoreStor documentation**

| Document | Description |
|---|---|
| QoreStor Installation Guide | Provides information on installation and operation requirements, supported platforms as well as procedures for installing QoreStor. |
| QoreStor User Guide | Provides information on configuring and using QoreStor. |
| QoreStor Release Notes | Provides the latest information about new features and known issues with a specific product release. |
| QoreStor Command Line Reference Guide | Provides information about managing QoreStor data backup and replication operations using the QoreStor command line interface (CLI). |
| QoreStor Interoperability Guide | Provides information on supported infrastructure components. |
| QoreStor Virtual Machine | Provides information on deploying the QoreStor virtual machine on VMware ESX or |

| Document | Description |
|---|---|
| Deployment Guide | Microsoft Hyper-V. |
| Additional whitepapers | Instructions and best practices for configuring additional Quest and third-party applications to work with QoreStor. |

**NOTE:** Check for the latest documentation updates and release notes at http://support.quest.com/qorestor. Read the release notes first because they contain the most recently documented information about known issues with a specific product release.

# Introducing Quest® QoreStor™

Quest® QoreStor™ is a software-defined secondary storage platform based on Quest's proven DR Appliance's resilient deduplication and replication technologies. With QoreStor, you can break free of backup appliances and accelerate backup performance, reduce storage requirements and costs, and replicate safer and faster to the cloud for data archiving, disaster recovery and business continuity.

QoreStor supports all of the major backup software applications in use today and can lower your backup storage costs to as little as $.16/GB while reducing your total cost of ownership.QoreStor achieves these results using patented Rapid technology as well as built-in, variable block-based deduplication and compression.

Lower costs and maximize the return on your IT investment by leveraging virtually any storage hardware, virtualization platform or cloud provider. QoreStor also supports many backup software solutions — so it's not just for Quest. Simple to deploy and easy to manage, QoreStor enables you to shrink replication time, improve data security and address compliance requirements.

QoreStor helps you to:

- Reduce on-premises and cloud storage costs with industry-leading deduplication and compression.
- Accelerate backup completion with protocol accelerators and dedupe.
- Shrink replication time by transmitting only changed data.
- Improve data security and comply with FIPS 140-2.
- Maximize return on investment for existing data protection technologies.
- Lower total cost of ownership through all-inclusive licensing.

QoreStor includes the following features:

- Hardware and software agnostic platform
- Next-generation storage dedupe engine
- Built-in protocol accelerators
- Support for a wide variety of data backup installations and environments.

# Understanding the QoreStor CLI

The QoreStor command line interface (CLI) provides the most efficient method for managing the status, data capacity, storage savings, and throughput of data containers. While some QoreStor functions can be managed through the QoreStor GUI, the CLI provides full access to all QoreStor features and functions.

# Accessing the QoreStor CLI commands

This guide assumes that your QoreStor system has been deployed in the proper network location and is accessible to your workstation.

## Accessing the CLI commands

***To access the command line interface for QoreStor:***

1. Using the terminal emulation application of your choice, connect to your QoreStor server.
2. At the system prompt, enter the user name for an account with sufficient privileges.
    - Type `<user name>`
    - Press **<Enter>**
3. At the password prompt, enter the password for the account used in the previous step:
    - Type `<password>`
    - Press **<Enter>**
4. Enter the desired command at the prompt. To view the available QoreStor CLI commands, type **help**.

Alternatively, you may access the command line interface through the QoreStore web terminal in the QoreStor GUI. (missing or bad snippet)

# QoreStor CLI commands overview

The following command groups are available in the QoreStor CLI.

For more information on each command group, run the following command:

```
<command name> --help show
```

**Table 2: QoreStor CLI Commands Overview**

| Command Group | Description |
|---|---|
| alerts | View system events and alerts. |
| authenticate | Configure Active Directory (AD) authentication. |
| cloud_tier | Configure a cloud connection. |
| connection | Configure OST or RDS access to a container. |
| container | Configure a filesystem to share over RDS or OST. |
| `iscsi` | Manage and view iSCSI connection types for VTL containers. |
| `ndmp` | Manage and view NDMP connection types for VTL containers. |

| Command Group | Description |
|---|---|
| maintenance | Repair the data and state of the system. Collect diagnostics for the product. |
| object_container | Configure and manage Object Container. |
| ost | Configure OST for Veritas (formerly Symantec) backup applications. |
| performance_tier | Configure a performance tier storage group. |
| qs_help | Display the QoreStor help command listing. |
| rda | Configure Rapid Data Access (RDA) for the NetVault application. |
| replication | Manage replication between systems. |
| schedule | Manage replication and cleaner schedules in the system. |
| seed | Configure and manage seeding import or export. |
| stats | View statistics for system components. |
| storage_group | Manage and view the storage groups on a QoreStor |
| system | Manage and view the system configuration. |
| user | Enable or disable service and root accounts on the node. |
| vtl | Manage and view VTL container types. |

# 3

# Managing QoreStor

This topic introduces the QoreStor CLI commands for configuring, managing, and viewing the current status of a QoreStor server. For example, the QoreStor CLI **alerts** and **system** commands both contain options that provide administrators with the capability to configure, manage, and display the status of the a QoreStor server.

The following list of commands provide the functionality for configuring, managing, and displaying QoreStor status:

- **Alerts**
- **Email_alerts**
- **OST** (OpenStorage Technology)
- **RDA** (Rapid Data Access)
- **Stats** (statistics)
- **Storage Group**
- **System**
- **User**

# Alerts Commands

This topic introduces the set of QoreStor CLI commands that enable you to perform the following tasks:

- Display system alerts and events.

# Alerts Command Usage

This topic introduces the **alerts** command usage:

- **alerts --show [options]**
- **alerts --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

## alerts --show

### Description

Displays the current list of system events.

**NOTE:** The default is to display the 30 most recent events (this example is intentionally brief). The count and index options can also be used to filter the list of events (**alerts --show --events --count <number>**).

### Syntax

```
alerts --show [--events] [--index <[-]number>] [--count <number>] [--all]
              [--alerts] [--index <[-]number>] [--count <number>] [--all]
              [--summary]
```

Where

```
--events    Display events.
--alerts    Display alerts.--index     Starting index to display / -num recent
events to skip.
--count     Count of alerts or events to display.
--all       Display all events / alerts.
--summary   Displays total number of alert messages.
```

### Result

```
alerts --show --events
Index  Severity  Time                 Event Message
188    INFO      2018-06-07 18:07:28  Successfully authenticated User admin.
187    INFO      2018-06-07 18:03:54  Optimization initialized on container "NVBU1".
186    INFO      2018-06-07 18:03:54  Container "NVBU1" is configured to access over
RDS by the following clients: * ('*' means access for everyone).
185    INFO      2018-06-07 18:03:54  Container "NVBU1" created successfully.
184    INFO      2018-06-07 18:02:34  Successfully authenticated User admin.
```

# alerts --help

### Description

Displays the listing of alerts and related options for using the QoreStor CLI.

### Syntax

```
alerts --help
```

### Result

```
Usage:
        alerts --show [--events] [--index <[-]number>] [--count <number>] [--all]
                      [--alerts] [--index <[-]number>] [--count <number>] [--all]
                      [--summary]

        alerts --help

alerts <command> <command-arguments>
<command> can be one of:
        --show         Displays system alerts and events.
```

```
For command-specific help, please type alerts --help <command>
For example:
            alerts --help show
```

# Authenticate Commands

This topic introduces the set of QoreStor CLI commands that let you configure QoreStor so it can authenticate with the Microsoft Windows Active Directory Services (ADS).

For information about specific authenticate commands, see Authenticate Command Usage.

# Authenticate Command Usage

This topic introduces the **authenticate** command usage:

- **authenticate --show [options]**
- **authenticate --join [options]**
- **authenticate --leave [options]**
- **authenticate --update --kerberos**
- **authenticate --add [options]**
- **authenticate --delete [options]**
- **authenticate --set --user <user name>**
- **authenticate --guestmode [options]**
- **authenticate --server_signing --mode <auto|mandatory|disabled|show>**
- **authenticate --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

## authenticate --show

### Description

Displays the current status of the Microsoft Active Directory Service (ADS) domain, or if it is not joined, it can display the status of any authorized local CIFS user.

**NOTE:** If this command is entered, but the QoreStor has not joined the ADS to any domain, the following message is displayed.

```
This system has not joined any domain.
```

### Syntax

```
authenticate --show [--users] [--domain <domain name>] [--login_group] [--
server_signing]
```

Where

```
--users            Lists all local CIFS users.
--domain           Lists time and IP/hostname information for the DC.
--login_group      Lists login group.
--server_signing   Display current CIFS Server signing settings.
```

### Result

```
Domain: ads.storage.local
```

If you have joined the ADS to a designated domain and you want to see the authorized users, enter the authenticate --show --users command to display the current status:

```
authenticate --show --users
administrator2
administrator
```

## authenticate --join

### Description

Joins the QoreStor to an Active Directory Services (ADS) domain when you specify the ADS domain name and a valid user (administrator) for that domain.

**NOTE:** When attempting to join the ADS domain, the administrator password is required for that domain to ensure that the join operation is successful. Supported domain names are limited to 64 characters in length and can only consist of a combination of A-Z, a-z, 0-9, and two special characters: a dash (-) and a period (.).

**NOTE:** If you had previously joined the QoreStor to an ADS domain before running Restore Manager (RM), after it completes you must manually rejoin the desired ADS domain using the `authenticate --join` command.

### Syntax

```
authenticate --join --domain <domain name> [--ou <org-unit name>] --user <user name>
[--domain-join-cli]
```

Where

```
--domain        Name of ADS domain to join.
--ou            Name of the organizational unit to join.
--user          Name of ADS user with permissions to join the domain.
--domain-join-cli      Alternate join method to join domain
```

### Result

```
Enter password for administrator@ads.storage.local:
Successfully joined domain ads.storage.local
Disabling NTP service... done.
Updated Windows Access Server Configuration.
Updated Kerberos configuration.
Updated machine password.
```

```
Updated DNS.
Restarting Windows Access Server... done.
```

**NOTE:** The `--ou` command is optional and allows for defining a specific organizational group in the ADS that requires its own administrative access rights (such as an executive management or finance group). In case of multiple organizational groups, use the following format: "<topLevelOU/middleLevelOU/LowerLevelOU/TargetOU>"

# authenticate --leave

### Description

Enables a QoreStor to leave a Microsoft Active Directory Services (ADS) domain when you provide a valid administrator password.

### Syntax

```
authenticate --leave [--user <user name>] [--force]
```

Where

```
--user    Name of ADS user with permissions to leave the domain.
--force   Leave the domain without informing ADS.
```

### Result

```
Enter password for administrator@ads.storage.local:
Successfully left domain ads.storage.local.
Updated Windows Access Server configuration.
Updated Kerberos configuration
Restarting Windows Access Server... done.
Enabling NTP service... done.
```

**NOTE:** The `--force` command is optional and allows the QoreStor to leave the ADS domain when communication between the system and the ADS domain is lost and the `--leave` operation is pending or in progress.

# authenticate --update

### Description

Updates a Microsoft Active Directory Service (ADS) Kerberos configuration (Kerberos is a computer network authentication protocol).

### Syntax

```
authenticate --update --kerberos
```

Where

```
--kerberos   Updates kerberos configuration.
```

### Result

```
Updated kerberos configuration.
```

# authenticate --add

### Description

Adds a new local CIFS workgroup user for CIFS authentication (and administrative tasks) after you provide and confirm the CIFS user password.

### Syntax

```
authenticate --add [--user <user name>][--login_group <DOMAIN\LOGIN GROUP>]
```

Where

```
--user          Name of local CIFS user to add.
--login_group   Name of login group to add (<domain>\<login group>)
```

### Result

```
Enter password for new CIFS user administrator2:
Re-enter password for new CIFS user administrator2:
Added CIFS user administrator2.
```

# authenticate --delete

### Description

Deletes an existing local CIFS workgroup user from CIFS authentication (and administrative tasks).

### Syntax

authenticate --delete [--user <user name>] [--login_group <DOMAIN\LOGIN GROUP>]

```
--login_group   Name of login group to add (<domain>\<login group>)
```

### Result

```
Deleted CIFS user administrator2.
```

# authenticate --set

### Description

Sets the password for an existing local CIFS workgroup user.

### Syntax

```
authenticate --set --user <user name>
```

Where

```
--user          Name of local CIFS user.
```

### Result

```
Enter new password for CIFS user administrator2:
Re-enter new password for CIFS user administrator2:
Changed administrator2's password.
```

**NOTE:** The QoreStor administrator that manages the QoreStor has a different set of privileges than does the CIFS user administrator. For example, only the QoreStor administrator can change the password for the CIFS user administrator.

# authenticate --guestmode

### Description

Configures all CIFS shares for guest-only access.

### Syntax

```
authenticate --guestmode [--enable] [--disable]
```

Where

```
--enable    Enable only guest access CIFS shares.
```

```
--disable   Disable only guest access for CIFS shares.
```

### Result

```
Restarting Windows Access Server... done.
```

**NOTE:** If you attempt to enable guestmode for all CIFS shares when the QoreStor is already joined to an ADS domain by (using the QoreStor CLI `authenticate --guestmode --enable` command), the following error message displays: *This node is already joined to domain <domainname>. Please leave the domain before enabling the guest-only mode.*

# authenticate --server_signing

### Description

Configures the server signing for Common Internet File System (CIFS) on a QoreStor.
The QoreStor CLI `--server_signing --mode` command has the following arguments:

- **auto** — Configures authentication via server signing to be automatically performed.
- **mandatory** — Configures authentication via server signing as mandatory, or the connection will be dropped.
- **disabled** — Disables authentication via server signing so that no connections are accepted.

### Syntax

```
authenticate --server_signing --mode <auto|mandatory|disabled>
```

Where

```
--mode   Mode of Server Signing.
```

### Result

```
Successfully added server signing to auto.
```

# authenticate --help

### Description

Displays the list of all authenticate-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
 authenticate --help
```

### Result

```
Usage:
       authenticate --show [--users]
                [--domain <domain name>]
                [--login_group]
                [--server_signing]

       authenticate --join --domain <domain name>
                [--ou <org-unit name>]
                --user <user name>
                [--domain-join-cli]

       authenticate --leave [--user <user name>]
                [--force]

       authenticate --update --kerberos

       authenticate --add [--user <user name>]
                [--login_group <DOMAIN\LOGIN GROUP>]

       authenticate --delete [--user <user name>]
                [--login_group <DOMAIN\LOGIN GROUP>]

       authenticate --set --user <user name>

       authenticate --guestmode [--enable]
                              [--disable]

       authenticate --server_signing --mode <auto|mandatory|disabled>

       authenticate --help

authenticate <command> <command-arguments>
```

```
<command> can be one of:
       --show             Displays current ADS domain, authorized local CIFS users and
login group.
       --join             Joins an ADS domain.
       --leave            Leaves an ADS domain.
       --update           Updates ADS configuration.
       --add              Creates a local workgroup user for CIFS authentication.
       --delete           Deletes a local workgroup user from CIFS authentication.
       --set              Sets the password for a local workgroup user.
       --guestmode        Configures all CIFS shares for guest only access.
       --server_signing   Configures server signing for CIFS.

For command-specific help, please type authenticate --help <command>
       eg:
       authenticate --help show
```

# Email_alerts Commands

This topic introduces the set of QoreStor CLI commands that enable you to perform the following tasks:

- Configure the Alert email service.
- Enable and/or disable email alerts notification.
- Test your email configuration.

# Email_alerts command usage

This topic introduces the **email_alerts** command usage:

- **email_alerts --clear-config**
- **email_alerts --enable**
- **email_alerts --disable**
- **email_alerts --status**
- **email_alerts --configure**
- **email_alerts --test-email**
- **email_alerts --help**

## email_alerts --clear-config

Removes the stored alert email configuration.

### Syntax

```
email_alerts --clear-config
```

### Result

The current configuration will be cleared.

## email_alerts --enable

Enables the QoreStor Alert email service.

> **NOTE:** The Alert email service must be configured before it can be enabled. Refer to email_alerts --configure for more information.

### Syntax

```
email_alerts --enable
```

### Result

```
Service enabled successfully.
```

## email_alerts --disable

Disables the QoreStor Alert email service.

### Syntax

```
email_alerts --disable
```

### Result

```
Service disabled successfully.
```

## email_alerts --status

Returns the status of the email_alerts service.

### Syntax

```
email_alerts --status
```

### Result

```
Service is not running.
```

## email_alerts --configure

Provides interactive prompts to configure email relay, sender name and email address, recipients, CC recipients, and BCC recipients.

### Syntax

```
email_alerts --configure
```

### Result

```
email_alerts --configure
Please enter the SMTP Relay FQDN or IP address:
Please enter the sender's email address:
Please enter the sender's name: QS Admin
Please enter the list of recipient email addresses:
Please enter the list of email addresses to be CC'ed:
Please enter the list of email addresses to be BCC'ed:
```

## email_alerts --test-email

Sends a test email to validate your configuration.

### Syntax

```
email_alerts --test-email
```

### Result

```
Success: Test email sent.
```

## email_alerts --help

### Description

Displays the listing of **email_alerts** options for using the QoreStor CLI.

### Syntax

```
email_alerts --help
```

### Result

```
Usage:
        email_alerts --clear-config | --enable | --disable | --status | --configure
| --test-email | --help

email_alerts <command>
<command> can be one of:
       --clear-config          removes the stored alert email configuration
       --enable                enables the QoreStor Alert Email service
       --disable               disables the QoreStor Alert Email service
       --status                checks that QoreStor Alert Email service is running
       --configure             interactive prompts to configure email relay, sender name and emai
address, recipients, CC recipients, and BCC recipients
       --test-email            send a test email

For command-specific help, please type email_alerts --help <command>
For example:
            email_alerts --help show
```

# OST

This topic introduces the set of OpenStorage Technology-related QoreStor CLI commands that enable you to perform the following tasks:

- Display command-specific information
- Delete the OST client
- Update the attributes of the OST client
- Limit the bandwidth consumed by OST
- List or clean up partial images

# OST Command Usage

This topic introduces the **ost** command usage:

- **ost --show [options]**
- **ost --update --opdup_encryption [options]**
- **ost --delete_client [options]**
- **ost --update_client [options]**
- **ost --limit --speed --target [options]**
- **ost --partial_images --containerid [options] --delete [Partial image path] --timeout <number of seconds>**
- **ost --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

## ost --show

### Description

Displays the current OpenStorage Technology (OST) configuration information for QoreStor. Parameters are described as follows:

- **config** — Displays OST configuration.
- **file_history** — Display(s) history of last 10 OST optimized duplication image file(s).
- **name** — OST container name.
- **active_files** — Display(s) current OST image files being replicated.
- **name** — OST container name.
- **clients** — Displays OST clients.
- **limits** — Replication speed limits.

### Syntax

```
ost --show [--config] [--file_history] [--name <name>] [--active_files] [--name
<name>] [--clients] [--limits]
```

Where

```
--config          Displays OST configuration.

--file_history     Display(s)  history  of  last  10  OST  optimized  duplication
image  file(s).

--name            OST container name.

--active_files    Display(s) current OST image files being replicated.

--name            OST container name.

--clients         Displays OST clients.

--limits          Replication speed limits.
```

### Result

```
OST Login Entry User            : backup_user
OST OPDUP Encryption            : Not Enabled
```

**NOTE:** To display other types of OST configuration information, substitute the --file_history, --name <name>, or --clients options in the QoreStor CLI command.

### Other Examples

Display the last 10 replicated files that were processed via the DMA optimized duplication process for an OST container (in this example, the container is “ost.”) by running the following:

**`ost --show --file_history --name ost`**

```
Data  replication  history:
 File                    Peer    IP             Peer    ID       Savings     Bytes
              Throughput        Replicated  At:           Encryption
 /1481068800/w1     10.250.240.232   10               100.00%     107374182400Bytes
1075139KiB/s     2016-12-07  07:58:19   None
```

Display the OST clients, by running the command: **`ost --show --clients`**

```
OST Client(s)  IP Address      Type   Plugin      OS                          Backup
Software       Last Access   Connection(s)   Mode
sekhar-w12-h58 10.250.213.14   OST    4.0.273.0   Windows Server 2012 64-bit
NetBackup 7.702.16    --            0               Dedupe
```

**NOTE:** The displayed output when using the QoreStor CLI **ost --show --clients** command could indicate a fourth type of mode value. Depending upon the client, this value would normally display **Auto**, **Dedupe**, **Passthrough**, or **Default**. However, you could potentially display a mode value of **Mixed**, which indicates that you had changed the mode using the QoreStor CLI while the client is still connected.

**NOTE:** Be aware that the mode for clients that were connected to the OST media server before configuration changes might be different that what is shown in the displayed output when using the QoreStor CLI ost --show --clients command. The configuration changes will be updated and reflect any future connections.

To verify the current state of an OST client, you can check these two sources:

- QoreStor CLI, using the ost --show --clients command
- QoreStor GUI, displaying the System Configuration page

These sources display information about the connected and configured clients. For example, when a system is connected to multiple times, these sources show the number of connections to that client and the mode. You can also change the mode from dedupe to the other supported modes. When this is done the displayed mode will change, but any active connections will remain. There are essentially two possible modes: **Dedupe** and **Passthrough**. To verify the current mode of an OST client, you can check these two sources of client statistics:

- QoreStor CLI, using the **stats --container --name** command
- QoreStor GUI, displaying the **System Configuration** page

In the **Storage Groups** page, click **Container Details** under the corresponding storage group to display the **Client Statistics** table. If the Network Savings level in this table displays some savings and the displayed Bytes Ingested value is different from the displayed Bytes Transferred, this indicates that the OST clients are working in the **Dedupe** mode. If not, this indicates that the OST containers are working in the **Passthrough** mode.

# ost --update

### Description

Sets the type of encryption that will be used by OST initiated opdup replication.

### Syntax

```
ost --update --opdup_encryption <none | aes128 | aes256>
```

Where

```
--opdup_encryption   Type of encryption to use on the wire.
```

### Result

```
OST OPDUP encryption updated to  aes128
```

# ost --delete_client

### Description

This command deletes the OST client and any edits that have been made to its default values. The next time a connection is established between the client and the QoreStor server, the default OST connection settings will be used. Deleting an OST client using this CLI command does not affect data already written to QoreStor.

### Syntax

```
ost --delete_client --name <OST Client Hostname>
```

Where

```
--name   Host name
```

### Result

```
Successfully deleted OST client acme-99.
```

# ost --update_client

### Description

Updates the attributes of an OST client (OST client name and mode). The OST client modes are **auto**, **passthrough**, and **dedupe**.However, the OST client operating mode depends upon how it is configured in QoreStor.

- **Auto** —Auto mode in QoreStor functions the same as Dedupe mode.
- **Passthrough** — The OST client passes all data to QoreStor for dedupe processing. This is also known as “server-side dedupe”.
- **Dedupe** — The OST client processes hashing on the data. This is also known as “source-side dedupe” and is the default mode. Source-side depuplication is resource intensive. On machines with less than four cores, or on 32-bit machines, performance may be reduced.

### Syntax

```
ost --update_client --name <OST Client Hostname> --mode <auto|passthrough|dedupe>
```

Where

```
--name   Hostname of client

--mode   OST modes (auto, dedupe, passthrough)
```

**NOTE:** You may be able to force writes for OST clients running in the **Passthrough** mode using the QoreStor CLI mode **--dedupe**command. The change in OST client mode is effective on the next backup operation when you are using Veritas NetBackup. (If you are using Veritas Backup Exec, you will need to restart this service for it to recognize that a new mode has been configured.)

### Result

```
OST client updated successfully.
```

# ost --limit

### Description

Limits the bandwidth consumed by OST (OpenStorage Technology) for a system you define by IP address or hostname (**--target**), by which you define the speed in kilobytes/second (KBps), megabytes/second (MBps), gigabytes/second (GBps), or an unlimited bandwidth (default).

### Syntax

```
ost --limit --speed <<num><KBps|MBps|GBps> | default> --target <ip address |
hostname>
```

Where

```
--speed    OST speed limit (eg. 10MBps).
```

```
--target   DR replication target name or IP address.
```

### Result

```
Successfully updated OST bandwidth limit for acmesys-49 to 10 MBps.
Changing traffic control policies ... done.
```

# ost --partial_images

### Description

Lists or cleans up partial images.

- **Container id** — ID of container.
- **Partial image path** — OST partial image path to delete.
- **Timeout** — Maximum timeout (in seconds) to list partial images.

### Syntax

```
ost --partial_images --containerid <Container id> [--delete <Partial image path>] [-
-timeout <> 0>]
```

Where

```
--containerid   Container ID.

--delete        OST partial image path to delete

--timeout       Maximum timeout(in seconds) to list partial images.
```

### Results

```
Image Name: K12
Image Date: 1481535029
Image Policy: DPA
Image Path: /1481500800/K12
Image Size: 251821817856
Image Status: 0
```

# ost --help

### Description

Displays the list of OpenStorage Technology (OST) ost-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
ost --help
```

### Result

```
Usage:
        ost  --show  [--config]
                [--file_history]  [--name  <name>]
                [--active_files]  [--name  <name>]
                [--clients]
                [--limits]

        ost  --update  --opdup_encryption  <none  |  aes128  |  aes256>

        ost  --delete_client  --name  <OST  Client  Hostname>

        ost  --update_client  --name  <OST  Client  Hostname>
                --mode  <auto|passthrough|dedupe>

        ost  --limit  --speed  <<num><KBps|MBps|GBps>  |  default>
                --target  <ip  address  |  hostname>

        ost  --partial_images  --containerid  <Container  id>
                [--delete  <Partial  image  path>]
                [--timeout  <>  0>]

        ost  --help

        ost  <command>  <command-arguments>
        <command>  can  be  one  of:
                --show                  Displays  command  specific  information.
                --update                Updates  the  OST  settings.
                --delete_client         Deletes  the  OST  client.
                --update_client         Updates  attributes  of  the  OST  client.
                --limit                 Delete  existing  bandwidth  rules  for  all
ports  and  set  new  throttling  limits  for  OST  replication  over  WAN.
                --partial_images        List  or  cleanup  partial  images.
```

# RDA

The set of **RDA** commands have the following functions:

- Displays command specific information.
- Deletes the Rapid Data Access (RDA) client.
- Updates attributes of a Rapid Data Access (RDA) client.
- Limits bandwidth consumed by Rapid Data Access (RDA) when replicating over a WAN link.
- Lists or cleans up partial images.

# RDA Command Usage

The following commands are run for **RDA**:

- **rda --show**
- **rda --update**
- **rda --delete_client**
- **rda --update_client**
- **rda --limit**
- **rda --partial_images**

## rda --show

### Description

The command displays the RDA-specific configurations.

### Syntax

```
rda --show
       [--config]
       [--file_history] [--name <name>]
       [--active_files] [--name <name>]
       [--clients]
       [--limits]
```

Where

```
--config              Displays RDA configuration.
--file_history     Display(s) history of last 10 RDA optimized deduplication
image files.

--name                RDA container name.
--active_files     Display(s) current active RDA image files being replicated

--name                 RDA container name.
--clients             Displays RDA clients.
--limits               Replication speed limits.
```

For example, to show the RDA clients, run the command: `rda --show --clients`

### Results

```
RDA Client(s)   IP Address   Type   Plugin   OS                 Backup Software   Last Access      Connection(s)   Mode
qorestor_1      10.230.36.58 RDS    4.1.0.224 Windows Server 2012 64-bit  NetVault          Jun 7 10:50:32  2               Default
```

**NOTE:** The displayed output when using the `rda --show --clients` command indicates a fourth type of mode value. Depending upon the client, this value equals Auto, Dedupe, Passthrough, or Mixed. Mixed indicates that you changed the mode while the client is still connected.

**NOTE:** The mode for clients that are connected to the RDA media server before configuration changes might be different than what is displayed when using the `rda --show --clients` command. The configuration changes are updated to reflect any future connections.

To verify the current state of an RDA client, you can check the two sources:

- QoreStor CLI, using the `rda --show --clients` command
- QoreStor GUI, displaying the Clients page

These sources display information about the connected and configured clients. When a system is connected multiple times, these sources show the number of connections to that client and the mode. You can also change the mode from **dedupe** to the other supported modes. When this is done the displayed mode changes, but any active connections remains. There are essentially two possible modes: **Dedupe** and **Passthrough**. To verify the current mode of an RDA client, you can check the two sources of client statistics:

- QoreStor CLI, using the `stats --container --name` command
- QoreStor GUI, displaying the Container Statistics page

In the Container Statistics page, click the Client Statistics tab (under Connection Type: RDS) to display the Client Statistics table. If the Network Savings level in this table displays some savings and the displayed Bytes Ingested value is different from the displayed Bytes Transferred, it indicates that the RDA clients are working in the **Dedupe** mode. If not, it indicates that the RDA containers are working in the **Passthrough** mode.

# rda --update

### Description

Sets the type of encryption that will be used by RDA initiated opdup replication.

### Syntax

```
rda --update --opdup_encryption <none | aes128 | aes256>
```

Where

```
--opdup_encryption   Type of encryption to use on the wire.
```

### Result

```
RDS OPDUP encryption updated to aes128
```

# rda --delete_client

### Description

The command deletes the Rapid Data Access (RDA) client and any edits that were made to its default values. The next time a connection is established between the client and the QoreStor, the default RDA connection settings will be used. Deleting an RDA client using this CLI command does not affect data already written to the QoreStor.

### Syntax

```
rda --delete_client --name <RDA Client Hostname>
```

Where

```
--name   Host name
```

For example, to delete the client TEST-W2K8–02, run the command:

```
rda --delete_client --name TEST-W2K8-02
```

### Result

```
Rapid Data Access (RDA) client TEST-W2K8-02 deleted successfully.
```

# rda --update_client

### Description

The command updates the attributes of a Rapid Data Access (RDA) client. The RDA client modes are **auto**, **passthrough**, and **dedupe**. If a RDA client has four or more CPU cores, it is considered to be dedupe-capable. However, the RDA client operating mode depends upon how it is configured in the QoreStor. For details, see ost --update_client --name <OST Client Hostname> --mode <auto|passthrough|dedupe>.

### Syntax

```
rda --update_client --name <RDA Client Hostname> --mode <auto|passthrough|dedupe>
```

Where

```
--name   Hostname of client
```

```
--mode   RDA modes (auto, dedupe, passthrough)
```

For example, to update the client mode as passthrough for the **BabuK-W2K8-02** client, run the command: `rda --update_client --name BabuK-W2K8-02 --mode passthrough`

### Result

```
Rapid Data Access (RDA) client BabuK-W2K8-02 with mode Pass-through added
successfully.
```
/p>

# rda --limit

### Description

The command limits the bandwidth consumed by RDA when replicating over a WAN link.

### Syntax

```
rda --limit --speed <<num><KBps|MBps|GBps> | default> --target <ip address |
hostname>
```

Where

```
--speed    RDA speed limit (eg. 10mbps).

--target   DR replication target name or IP address.
```

### Result

```
Successfully updated  bandwidth limit for testbackup to 4 GBps.
```

# rda --partial_images

### Description

Lists or cleans up partial images.

- **Container id** — ID of container.
- **Partial image path** — RDA partial image path to delete.
- **Timeout** — Maximum timeout (in seconds) to list partial images.

### Syntax

```
rda --partial_images --containerid <Container id> [--delete <Partial image path>] [--timeout <> 0>]
```

Where

```
--containerid   Container ID.

--delete        RDA partial image path to delete

--timeout       Maximum timeout(in seconds) to list partial images.
```

### Results

```
Image Name: rda_SOAK-MAX_DR4300-20_100M_soakw78_20160916053405-seed273481828
Image Date: 00

Image Path: /0000000000/rda_SOAK-MAX_DR4300-20_100M_soakw78_20160916053405-
seed273481828
Image Size: 104857600
Image Status: 0
```

# rda --help

### Decription

Displays the list of RDA-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
rda --help
```

**Result**

```
       rda --show [--config]
               [--file_history] [--name <name>]
               [--active_files] [--name <name>]
               [--clients]
               [--limits]

       rda --update --opdup_encryption <none | aes128 | aes256>

       rda --delete_client --name <RDA Client Hostname>

       rda --update_client --name <RDA Client Hostname> --mode <auto|passthrough|dedupe>

       rda --limit --speed <<num><KBps|MBps|GBps> | default> --target <ip address |
hostname>

       rda --partial_images --containerid <Container id> [--delete <Partial image path>]
[--timeout <> 0>]

       rda --help

       rda <command> <command-arguments>
   <command> can be one of:
               --show                  Displays command specific information.
               --delete_client         Deletes the Rapid Data Access (RDA) client.
               --update_client         Updates attributes of a Rapid Data Access (RDA) client.
               --limit                 Delete existing bandwidth rules for all ports and set new
limits for RDA replication over WAN.
               --partial_images        Lists or cleans up partial images.

For command-specific help, please type rda --help <command>
        eg:
            rda --help show
```

# Sc_manager command

The **sc_manager** command have the following functions:

- Displays the current status of Secure Connect.
- Enables Secure Connect
- Disables Secure Connect

# Sc_manager Command Usage

The following commands are run for **sc_manager**:

- **sc_manager --status**
- **sc_manager --disable**
- **sc_manager --enable**
- **sc_manager --help**

# sc_manager status --property <path_to_sc_client.property_file>

**NOTE:** The **sc_manager** command must be run using the **root** account.

### Description

Displays the Secure Connect status for the machine on which the command is run.

### Syntax

If run from the directory containing the sc_client.property file:

```
sc_manager status
```

If run from a different directory:

```
/opt/qorestor/bin/sc_manager status --property <path_to_sc_client.property_file>
```

### Result

```
SecureConnect.enabled = true
```

# sc_manager disable --property <path_to_sc_client.property_file>

**NOTE:** The **sc_manager** command must be run using the **root** account.

### Description

Disables Secure Connect for the machine on which the command is run.

### Syntax

If run from the directory containing the sc_client.property file:

```
sc_manager disable
```

If run from a different directory:

```
/opt/qorestor/bin/sc_manager disable --property <path_to_sc_client.property_file>
```

### Result

```
SecureConnect.enabled = false
```

## sc_manager enable --property <path_to_sc_client.property_file>

### Description

Enables Secure Connect for the machine on which the command is run.

### Syntax

If run from the directory containing the sc_client.property file:

```
sc_manager enable
```

If run from a different directory:

```
/opt/qorestor/bin/sc_manager enable --property <path_to_sc_client.property_file>
```

### Result

```
SecureConnect.enabled = true
```

# Stats

This set of QoreStor CLI commands let you display the current statistics for a QoreStor in the following categories:

- All containers (cumulative): **--system**
- CPU: **--cpu**
- Memory: **--memory**
- NFS: **--nfs**
- CIFS: **--cifs**
- OST media server: **--ost**
- RDS media server **--rds**
- NDMP: **--ndmp**
- Completed NDMP sessions: **--ndmp_completed**
- iSCSI: **--iscsi [--verbose]**
- A specific container: **--container --name**
- Storage group: **--storage_group --name <name>**
- Replication: **--replication**
- Cleaner: **--cleaner**
- Clients: **--clients [--type <NFS|CIFS|OST|RDS|NDMP|ISCSI>]**

- Seeding: **--seed**
- Cloud tiers: **--cloud_tier**
- Peformance tier: **--performance_tier**
- Help: **--help**

In addition, this QoreStor CLI command also allows you to reset the following statistic types:

- RDS **--reset --rds**

# Stats Command Usage

This topic introduces the **stats** command usage:

- **stats --system**
- **stats --cpu**
- **stats --memory**
- **stats --nfs**
- **stats --cifs**
- **stats --ost**
- **stats --rds**
- **stats --container --name**
- **stats --storage_group --name**
- **stats --replication [options]**
- **stats --cleaner**
- **stats --clients [options]**
- **stats --reset [options]**
- **stats --seed**
- **stats --performance_tier**
- **stats --cloud_tier**
- **stats --object_direct**
- **stats --archive_tier**
- **stats --object_container**
- **stats --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

# stats --system

## Description

Displays the current cumulative system statistics for all of the configured containers on a QoreStor.

## Syntax

```
stats --system
```

## Result

```
stats --system

# stats --cpu

### Description

Displays the current cumulative CPU statistics for a QoreStor.

### Syntax

```
stats --cpu
```

### Result

```
13:00:00 up 9 days, 19:24,  2 users,  load average: 1.12, 1.20, 1.18
Cpu(s):  1.4%us,  2.3%sy,  4.0%ni, 99.3%id,  0.0%wa, 0.0%hi,  0.0%si,  0.0%st
```

# stats --memory

### Description

Displays the current memory statistics in kilobytes (kB) for a QoreStor.

### Syntax

```
stats --memory
```

### Result

```
MemTotal                        : 98730140 kB
MemFree                         : 423060 kB

# stats --iscsi

### Description

This command displays statistics for iSCSI sessions on the current QoreStor system. The **--verbose** option provides detailed session information for the cartridges in the VTL.

### Syntax

```
stats --iscsi --verbose
```

### Result

```
# stats - iscsi
 Bytes  Written                          Bytes  Read
 1247953038336                          2253404205

# stats --container

## Description

Displays the current statistics for a specific container in a QoreStor that you define by name using the QoreStor CLI --name <name> command.

## Syntax

```
stats --container --name <name>
```

Where

```
--name   Name of container.
```

## Result

```
stats --container --name cifs-dr --verbose
```

```

# stats --cleaner

The **stats --cleaner** command displays the current running cleaner progress and the amount of time taken to complete its latest full pass. The Cleaner is an asynchronous process in the QoreStor that reclaims disk storage space by reclaiming space that previously contained unreferenced datastore files.

### Syntax

```
stats --cleaner
```

### Result

```

# stats --clients

### Description

Displays the current clients that are configured on the QoreStor.

To filter the list of clients to display a specific client type on a QoreStor, use the QoreStor CLI **--type** command option.

**NOTE:** For OST clients, the value under **Connections** is **0** (zero) when the connection is configured (but it is not in use), and **1** when the connection is in use.

### Syntax

```
stats --clients [--type <NFS|CIFS|OST|RDS|NDMP|ISCSI>]
```

Where

```
--type   Type of clients (OST|RDS only).
```

### Result

```
No OST client(s) are connected.

RDS Client(s)
Type  Plugin   OS                    Backup Software        Last Access
Connection(s) Mode
```

```
BabuK-W2K8-02
RDS   2.1.201  Windows Server 2008 R2 NetVault 9.20 Build 12 Aug 13 07:53:26 1
Passthrough   R720xd-Netvault
RDS   --       --                    --                    --              0
Default
```

# stats --reset

### Description

Resets the current RDS statistics for a QoreStor.

### Syntax

```
stats --reset [--rds] [--datacheck]
```

Where

```
--rds         Reset statistics for RDS connections.

--datacheck   Reset statistics for online data verification
```

### Result

```
RDS Protocol message statistics are reset successfully.
```

# stats --seed

### Description

Use to monitor the seeding progress.

### Syntax

```
stats --seed
```

### Result

```

# stats --help

### Description

Displays the list of all stats-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
stats --help
```

### Result

```
Usage:

stats --system
stats --cpu
stats --memory
stats --nfs
stats --cifs
stats --ost
stats --rds
stats --container --name <name> [--verbose]
stats --storage_group --name <name>
stats --replication [--verbose][--name <name>]
stats --cleaner
stats --clients [--type <NFS|CIFS|OST|RDS>]
stats --reset [--rds]
stats --seed
stats --performance_tier
stats --cloud_tier
stats --object_direct
stats --archive_tier
stats --object_container
stats --help

stats <command> <command-arguments>
<command> can be one of:
       --system               Displays cumulative statistics for all containers.
       --cpu                  Displays CPU statistics.
       --memory               Displays statistics for memory.
       --nfs                  Displays statistics for NFS.
       --cifs                 Displays statistics for CIFS.
```

```
       --ost                   Displays statistics for OST server.
       --rds                   Displays statistics for RDS server.
       --container             Displays statistics for a specific container

       --storage_group         Displays statistics for a specific storage_group

       --replication           Displays statistics for replication.
       --cleaner               Displays statistics for cleaner.
       --clients               Displays client information.
       --reset                 Resets statistics.
       --seed                  Seeding statistics.
       --performance_tier      Displays statistics for performance tier.
       --cloud_tier            Displays statistics for cloud tier.
       --object_direct         Displays cumulative statistics for all object direct storage
contatainers
       --archive_tier          Displays statistics for cloud archive tier
       --object_container      Displays statistics for Object container

For command-specific help, please type stats --help <command>
               eg:
                       stats --help system
```

# Storage Group commands

This set of QoreStor CLI commands let you manage the storage groups on a QoreStor, enabling you to perform tasks, such as adding or deleting a storage group, updating a storage group, updating encryption settings, updating compression settings, and setting a passphrase.

# Storage Group Command Usage

This topic introduces the **storage_group** command usage:

- **storage_group --show**
- **storage_group --add --name**
- **storage_group --update --name**
- **storage_group --encryption --name**
- **storage_group --delete --name**
- **storage_group --setpassphrase --name**
- **storage_group --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

# storage_group --show

### Description

Displays the current list of storage groups on the QoreStor. If you specify the --name option, you can view details of a specific storage group. The --verbose option displays more details.

### Syntax

```
storage_group --show [--name <name>] [--verbose]
```

Where

```
--name      Display details for a specific Storage group.

--verbose   Display more details
```

### Result

```
Storage_group Name              : DefaultGroup
Storage_group Compression Type  : Fast
Storage_group Encryption Set    : Off
Storage_group Encryption Mode   : Off
Storage_group Rotate Period     : 0
Storage_group Passphrase set    : No
Storage_group Quota limit       : Unlimited
Storage_group Created On        : Thu Nov 17 00:40:14 2016 PST
Storage_group Created Bld       : 62141
DefaultGroup's Containers
-------------------------
backup
vtl-iscsi
```

# storage_group --add

### Description

Adds a new storage group to the QoreStor with the name specified by the --name command option.

**NOTE:** When adding a name, valid values for the name are (a-z, A-Z, 0–9, '_', and '_')

**NOTE:** Do not change the **chunk_type** parameter from the default setting unless directed to do so by Quest Support.

You can also set the compression mode for the storage group as fast or best, described as follows:

- **Fast** — Results in shorter backup time, but with less space savings.
- **Best** — Provides the highest space savings, but with a longer backup time.

### Syntax

```
storage_group --add --name <name> [--compression_mode <fast|best>][--quota <Quota
value in GiB or TiB>]
```

Where

```
--name                  Name of the storage group. Valid values are [a-z,A-Z,0-9,'-' and '_'] and
maximum of 32 characters.
--compression_mode      Valid values are Fast and Best.
--quota                 Quota value in GiB or TiB.
```

### Result

```
Storage Group "StorageGroup_1" created successfully.
```

## storage_group --update

### Description

Allows you to modify the settings for the specified storage group.

### Syntax

```
storage_group --update --name <name> [--compression_mode <fast|best>] [--quota
<Quota value in GiB or TiB>]
```

Where

```
--name                   Name of the storage group. Valid values are [a-z,A-Z,0-9,'-' and '_'] and
maximum of 32 characters.
--compression_mode       Valid values are Fast and Best
--quota                  Quota value in GiB or TiB.
```

### Result

```
Storage Group "StorageGroup_1" updated successfully.
```

## storage_group --encryption

### Description

Allows you to set the encryption level for a specified storage group on the QoreStor. You turn encryption on or off by using the --set ON or --set OFF command options. The --mode option sets the mode of key lifecycle management as one of the following:

- static—A global, fixed key is used to encrypt all data.
- internal—Content encryption keys are generated and rotated on a specified period of days.

If you select Internal as the mode of key management, you need to set the --interval option, which specifies the number of days for key rotation when a new key is to be generated.

**NOTE:** In Internal mode there is a maximum limit of 1023 keys. The key rotation period is set to 30 days by default when the passphrase is set and/or encryption is turned on. You can later change the key rotation period from 7 days to 70 years for internal mode.

**NOTE:** After encryption is enabled, all of the data that is backed up is encrypted and is kept encrypted until it is expired and cleaned by the system cleaner. Note that encryption is an irreversible process.

**NOTE:** Due to export regulations, the encryption at rest feature is not available in certain markets, and, therefore, may not be available in your locale.

### Syntax

```
storage_group --encryption --name <name> [--set <ON | OFF>] [--mode < static |
internal >] [--interval <7 days to 70 years>]
```

Where

```
--name       Name of the storage group. Valid values are [a-z,A-Z,0-9,'-' and '_']
and maximum of 32 characters.
--set        Valid values are On and Off.
--mode       Valid values are static and internal.
--interval   Valid values are between 7 days to 70 years (in days)
```

### Result

```
Storage Group "StorageGroup_1" updated successfully.
```

## storage_group --delete

### Description

Deletes the specified storage group from the QoreStor.

**NOTE:** Before a storage group can be deleted, all of the containers inside the storage group must first be deleted.

### Syntax

```
storage_group --delete --name <name>
```

Where

```
--name   Name of storage_group.
```

### Result

```
Storage Group "StorageGroup_1" has been deleted.
```

## storage_group --setpassphrase

### Description

Sets the passphrase for the specified storage group to be used to encrypt content encryption keys. (The passphrase string can take up to 255 characters. And, alphanumeric and special characters can be entered as part of the

passphrase string.) This command will prompt you to enter and confirm a passphrase. This command also requires a filesystem server restart.

**NOTE:** It is mandatory to define a passphrase to enable encryption for a storage group. If the passphrase is compromised or lost, the administrator should change it immediately so that the content encryption keys do not become vulnerable.

### Syntax

```
storage_group --setpassphrase --name <name>
```

Where

```
--name   Storage group name
```

### Result

```
Storage Group "StorageGroup_1" updated successfully.
Passphrase updated successfully.
```

## storage_group --help

### Description

Displays the list of all storage_group-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
storage_group --help
```

### Result

```
Usage:

storage_group --show [--name <name>]
       [--verbose]

storage_group --add --name <name>
       [--compression_mode <fast|best>]
       [--quota <Quota value in GiB or TiB>]

storage_group --update --name <name>
       --compression_mode <fast|best>
       [--quota <Quota value in GiB or TiB>]

storage_group --encryption --name <name>
       [--set <ON | OFF>]
       [--mode < static | internal >]
       [--interval <7 days to 70 years>]

storage_group --delete --name <name>

storage_group --setpassphrase --name <name>
```

```
storage_group --help

storage_group <command> <command-arguments>
<command> can be one of:
--show            Displays the current list of storage_group.
--add             Adds a new storage_group.
--update          updates a storage_group.
--encryption      updates encryption settings of a storage_group.
--delete          Deletes an existing storage_group.
--setpassphrase   sets passphrase to a storage_group.

For command-specific help, please type storage_group --help <command>
       eg:
               storage_group --help show
```

# System

This QoreStor CLI command and its options allow you to perform the a variety of system-related tasks, including the following:

- Displaying the current system configuration
- Displaying and updating your QoreStor license configuration.
- Adding additional storage paths to QoreStor.

# System Command Usage

This topic introduces the **system** command usage:

- **system --show [options]**
- **system --license [options]**
- **system --storage [options]**
- **system --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

## system --show

### Description

Displays information about the current QoreStor configuration.

### Syntax

```
system --show [--storage] [--license] [--verbose] [--version]
```

Where

```
--storage   Display system storage information.
--license   Shows the installed license.
--verbose   Shows more information.
--version   Display software version of the system.
```

### Result

```
Version               : 5.0.0
Build                 : 155
```

# system --license

### Description

QoreStor installs with a 1 TB trial license. If you have purchased a perpetual license, you can install it using the **system --license** command, as described below.

When you have downloaded your license file, you will need to copy it to the QoreStor server before installing the license. In the examples below <path> is used to represent the directory that contains the license file.

### Syntax

```
system --license [--show] [--verbose] [--validate] [--file <path>] [--add] [--
file <path>]
```

Where

```
--show       Shows the installed license.
--verbose    Shows more information.
--validate   Validates the license file.
--add        Installs the license file.
--file       License file path.
```

### Result

```
License file is valid and can be installed.
```

To add a validated license for a QoreStor server, use the following QoreStor CLI command:

```
system --license --add --file <path>
License file has successfully installed.
```

# system --storage

### Description

Adds the volume at the specified path to the QoreStor server and shows the current storage configuration.

### Syntax

```
system --storage [--add] [--path <path>] [--show]
```

Where:

```
--add    Add the data storage.
--show   Show the data storage.
--path   Path to the data storage.
```

### Result

```
ENCLs   Path            Total(GiB) Available(GiB) Used(GiB) Status

ENCL_0 /quest/ocaroot   599        307            292       On
```

### Other Examples

To add storage to QoreStor, use the command below. In this example, the path to the storage is **/qs4**.

```
system --storage --add --path /qs4
```

### Result

```
Running IOPS tests on /qs4, takes few minutes

Sequential and Random IOPS tests passsed on /qs4
WARNING: IO will be stopped during storage addition.
Do you want to continue (yes/no) [n]? yes
Stopping filesystem... Done.
Configuring data storage volume... Done.
Starting filesystem... Done.
```

# system --help

### Description

Displays the list of all system-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
system --help
```

## Result

```
Usage:
       system --show
              [--storage]
              [--license] [--verbose]
              [--version]

       system --license
              [--show] [--verbose]
              [--validate] [--file <path>]
              [--add] [--file <path>]

       system --storage [--add] [--path <path>]
              [--show]
```

```
        system --help

    system <command> <command-arguments>
    <command> can be one of:
        --show                  Displays command specific information.
        --license               Installs the license on the machine.
        --storage               Configure / Display storage properties.

For command-specific help, please type system --help <command>
        eg:
            system --help show
```

# User

This topic introduces the QoreStor CLI commands that allow you to manage user accounts by enabling or disabling user accounts, adding and updating users, setting passwords, deleting users, and displaying the list of current active user accounts logged in to a QoreStor.

# User Command Usage

This topic introduces the **user** command usage:

- **user --show [options]**
- **user --add --name [options]**
- **user --update --name [options]**
- **user --delete --name**
- **user --setpassword --name**
- **user --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

## user --show

### Description

Displays the current status of the service and root user accounts (using the **user --show --users** command), and also displays the login types and login times on a QoreStor (using the **user --show --logins** command).

### Syntax

```
user --show [--users]
       [--logins]
```

```
       [--verbose]
       [--name <user name>]
       [--roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_connect|object>]
```

Where

```
--users     List of users.
--logins    List of logins.
--verbose   verbose
--name      show a specific user.
--roles     List all users who has these roles
```

### Result

```
Service Account                 : Disabled
Root Account                    : Enabled

User Name                       : backup_user
User Roles                      : OST,RDA

User Name                       : admin
User Roles                      : administrator
```

## Other Examples

Displays the current status of login attempts on a QoreStor.

```
user --show --logins
User Name       Terminal    Login Time
root            pts/1       Oct 24 10:51 (10.15.13.4)
root            pts/2       Oct 23 20:41 (10.18.0.1)
root            pts/3       Oct 23 20:41 (10.15.0.13)
root            pts/5       Oct 24 09:35 (10.20.21.6)
administrator   pts/6       Oct 24 12:32 (acme13.storage.local)
root            pts/7       Oct 24 12:24 (10.18.11.12)
```

# user --add

### Description

Adds a user account with the specified username.

### Syntax

```
user --add --name <user name>
       [--roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_connect|object>]
       [--full_name <full name>]
       [--phone <phone number>]
       [--email_addr <e-mail address (e.g. name@company.com)>]
       [--description <anything>]
```

Where

```
--name          user name
--roles         user role
--full_name     user's full name
--phone         phone number
--email_addr    email address
--description   description
```

### Result

```
Enter new password:
Re-type password:
User "Test_User" created successfully.
```

# user --update

### Description

Updates a specified user account. You can update the username, add roles to or remove roles from the account, add information such as full name, phone number, email address, or description.

### Syntax

```
user --update --name <user name> [--new_name <user name>]
       [--add_roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_connect|object>]
       [--remove_roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_
connect|object>]
       [--full_name <full name>]
       [--phone <phone number>]
       [--email_addr <e-mail address (e.g. name@company.com)>]
       [--description <anything>]
```

Where

```
--name           user name
--new_name       new user name
--add_roles      user role
--remove_roles   user role
--full_name      user's full name
--phone          phone number
--email_addr     email address
--description    description
```

### Result

```
Successfully updated User Test_User.
```

## Other Examples

The example below adds the **secure_connect** role to a user account

### Syntax

```
user --update --name test1 --add_roles secure_connect
```

### Result

```
Successfully updated User test1.
```

## user --delete

### Description

Deletes the specified user account.

### Syntax

```
user --delete --name <user name>
```

Where

```
--name   user name
```

### Result

```
User "Test_User2" has been deleted.
```

## user --setpassword

### Description

Sets a password for the specified user account.

### Syntax

```
user --setpassword --name <user name>
```

Where

```
--name   user name
```

### Result

```
Enter new password:
Re-type password:
Successfully updated User Test_User2.
```

## user --help

### Description

Displays the list of all user-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
user --help
```

### Result

```
Usage:
       user --show [--users]
               [--logins]
               [--verbose]
               [--name <user name>]
               [--roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_connect|object>]

        user --add --name <user name>
               [--roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_connect|object>]
               [--full_name <full name>]
               [--phone <phone number>]
               [--email_addr <e-mail address (e.g. name@company.com)>]
               [--description <anything>]

       user --update --name <user name>
               [--new_name <user name>]
               [--add_roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_
connect|object>]
               [--remove_roles <cifs|ost|rda|ndmp|iscsi|monitor|administrator|secure_
connect|object>]
               [--full_name <full name>]
               [--phone <phone number>]
               [--email_addr <e-mail address (e.g. name@company.com)>]
               [--description <anything>]

       user --delete --name <user name>

       user --setpassword --name <user name>

       user --help

user <command> <command-arguments>
<command> can be one of:

    --show             Displays command specific information.
    --add              adds a user account.
    --update           updates a user account.
    --delete           delete a user account.
    --setpassword      sets password to a user account.

For command-specific help, please type user --help <command>

For example:

    user --help show
```

# 4

# Managing QoreStor Storage Operations

This topic introduces the QoreStor CLI commands that you can use for configuring and managing QoreStor backup operations and scheduling when to run Replication and disk Cleaner operations.

The QoreStor CLI commands that provide these capabilities are grouped into the following categories:

- **Connection:** configuring/managing connections to storage containers
- **Container:** configuring/managing storage and replication relationships
- **Replication:** configuring/managing replication operations
- **Seeding:** managing seeding import and export
- **Schedule:** configuring/managing the Replication and Cleaner schedules for QoreStor

# Cloud_tier

This topic introduces the set of QoreStor CLI commands that allow you to manage, configure, and display connection-related settings for cloud_tiers on a QoreStor server. For more information, see Container Command Usage .

# Cloud_tier Command Usage

This topic introduces the **cloud_tier** command usage:

- **cloud_tier --show [options]**
- **cloud_tier --add [options]**
- **cloud_tier --update [options]**
- **cloud_tier --delete [options]**
- **cloud_tier --setpassphrase**
- **cloud_tier --enable [options]**
- **cloud_tier --purge-ssl-certificate**
- **cloud_tier --src_cont_list [--cloud_archive]**
- **cloud_tier --help**

# cloud_tier --show

### Description

Displays the current cloud connection details..

### Syntax

```
cloud_tier --show [--verbose]
       [--cloud_archive]
```

Where

```
--verbose              Display more details.
--cloud_archive        View details of cloud archive
```

### Result

```
Cloud_tier Name : DefaultCloudTier
Cloud_tier Compression Type : Fast
Cloud_tier Encryption Set : On
Cloud_tier Encryption Type : Static
Cloud_tier Rotate Period : 0
Cloud_tier Passphrase set : Yes
```

# cloud_tier --add

### Description

Adds a new cloud connection.

**NOTE:** You will need your cloud provider connection string to properly configure the cloud tier.

**For Azure:**

The Connection String can be found in your Azure portal under Storage Accounts >Access leys > Connection string

**For AWS S3 and compatible platforms:**

AWS Connection String to be formed from the Security credentials in the below format.

```
"accesskey=<ABDCEWERS>;secretkey=< >; loglevel=warn; region=<aws-region>;"
```

The correct Region Name can be obtained from

https://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

### Syntax

```
cloud_tier --add --cloud_container <bucket name> --cloud_provider <AWS-
S3|AZURE|Wasabi-S3|Google-S3|IBM-S3|S3-Compatible>
       [--cloud_archive_service <S3-Glacier|S3-Deep-Archive>]
       [--archive_retention_in_warm <1 to 365 days>]
       [--archive_role_arn <archive role arn>]
       [--archive_restore_type <Batch|Lambda>]
```

where

```
 --cloud_container                  Name of the cloud container. Valid values
are [a-z,A-Z,0-9,'-'].
 --cloud_provider                    Name of the cloud service provider. Valid
values are [a-z,A-Z,0-9,'-'].
 --cloud_archive_service          Name of the cloud archive service. Valid
values are [a-z,A-Z,0-9,'-'].
 --archive_retention_in_warm    Valid values are [0-9], default 7 days. Value
entered is in days and counted from date of restore.
 --archive_role_arn             Valid values are [a-z,A-Z,0-9,'_','-',':','/']
 --archive_restore_type         Valid values are Batch or Lambda
```

### Result

```
Enter AWS cloud connection string to connect to container <name>:
Checking if container [<name>] is empty...
Container empty test pass. Container [<name>] in the cloud is empty.
Connection credentials validated successfully.
Cloud Tier created successfully.
```

# cloud_tier --update

### Description

Updates a cloud connection details.

### Syntax

```
cloud_tier --update [--cloud_password]
       [--cloud_archive]
       [--archive_retention_in_warm <1 to 365 days>]
       [--archive_role_arn <archive role arn>]
       [--archive_restore_type <Batch|Lambda>]
```

Where

```
--cloud_password               Updates cloud connection password.
--cloud_archive                Update connection for cloud archive
--archive_retention_in_warm    Valid values are [0-9], default 7 days. Value entered
is in days and counted from date of restore.
--archive_role_arn             Valid values are [a-z,A-Z,0-9,'_','-',':','/']
--archive_restore_type         Valid values are Batch or Lambda
```

### Result

```
Enter cloud connection string to connect for storage_group <cloud_tier name> :
Connection credentials validated successfully.
Cloud Tier updated successfully.
```

# cloud_tier --delete

### Description

Deletes an existing cloud connection.

### Syntax

```
cloud_tier --delete [--cloud_archive]
```

Where

```
--cloud_archive Deletes the cloud archive and its connection
```

### Result

Storage Group "DefaultCloudTier" has been deleted.

# cloud_tier --setpassphrase

### Description

sets passphrase to a cloud connection.

### Syntax

```
cloud_tier --setpassphrase [--cloud_archive]
```

Where

```
--cloud_archive         Set passphrase for cloud archive connection
```

### Result

```
Storage Group "DefaultCloudConnector" updated successfully.

Passphrase updated successfully.
```

# cloud_tier --enable

### Description

Enable cloud replication for source container.

### Syntax

```
cloud_tier --enable --src_name <name>
       [--cloud_archive]
```

Where

```
--src_name        Name of the source container. Valid values are [a-z,A-Z,0-9,'-'].

--cloud_archive   Enable connection for cloud archive
```

### Result

```
Successfully enabled cloud replication.
```

## cloud_tier --purge-ssl-certificate

### Description

Remove the cached self signed ssl certificate.

### Syntax

```
cloud_tier --purge-ssl-certificate
```

### Result

## cloud_tier --src_cont_list

### Description

Displays the source container list of an existing cloud connection.

### Syntax

```
cloud_tier --src_cont_list
       [--cloud_archive]
```

Where

```
--cloud_archive   Displays cloud archive tier connection source containers list
```

### Result

```
Cloud source container entries are:
ObjectContainer (groupid: 3)
```

## cloud_tier --help

### Description

Displays the list o**f cloud_tier** related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
cloud_tier --help
```

### Result

```
cloud_tier --show [--verbose]
       [--cloud_archive]

cloud_tier --add --cloud_container <bucket name>
```

```
       --cloud_provider <AWS-S3|AZURE|Wasabi-S3|Google-S3|IBM-S3|S3-Compatible>
       [--cloud_archive_service <S3-Glacier|S3-Deep-Archive>]
       [--archive_retention_in_warm <1 to 365 days>]
       [--archive_role_arn <archive role arn>]
       [--archive_restore_type <Batch|Lambda>]

cloud_tier --update [--cloud_password]
       [--cloud_archive]
       [--archive_retention_in_warm <1 to 365 days>]
       [--archive_role_arn <archive role arn>]

cloud_tier --delete [--cloud_archive]

cloud_tier --setpassphrase [--cloud_archive]

cloud_tier --enable --src_name <name>
       [--cloud_archive]

cloud_tier --purge-ssl-certificate

cloud_tier --src_cont_list [--cloud_archive]

cloud_tier --help

cloud_tier <command> <command-arguments>

       <command> can be one of:
       --show                    Displays the current cloud connection details.
       --add                     Adds a new cloud connection.
       --update                  Updates a cloud connection details.
       --delete                  Deletes an existing cloud connection.
       --setpassphrase           sets passphrase to a cloud connection.
       --enable                  Enable cloud replication for source container.
       --purge-ssl-certificate   Remove the cached self signed ssl certificate.
       --src_cont_list           Source container list of an existing cloud connection.

For command-specific help, please type cloud_tier --help <command>
       eg:
       cloud_tier --help show
```

# Connection

This topic introduces the set of QoreStor CLI commands that allow you to manage, configure, and display connection-related settings for containers on a QoreStor server. For more information, see Container Command Usage .

# Connection Command Usage

This topic introduces the connection command usage:

- **connection --show [options]**
- **connection --add --name [options]**
- **connection --update [options]**
- **connection --delete [options]**
- **connection --enable [options]**
- **connection --disable [options]**
- **connection --help**

**NOTE:** If you specify a command without supplying the expected value or option, you are prompted to provide the correct value or option.

## connection --show

### Description

Displays the current connections on a container.

**NOTE:** In addition to displaying the current status of an existing container connection, this command also verifies if an existing container connection is disabled (by listing its status as offline).

### Syntax

```
connection --show [--name <name>] [--type <NFS|CIFS|OST|RDS|NDMP|ISCSI>][--verbose]
```

Where

```
--name      Name of container. ABC
--type      Type of sharing (NFS|CIFS|OST|RDS|NDMP|ISCSI).
--verbose   Show further details.
```

### Result

```
Container Name                Connection Type
Target                           RDS
avc                              RDS
```

### Other Examples

Display the complete status of all existing container connections by using the **--verbose** command on a QoreStor (this example only shows a partial display of the total output):

```
Container Entry ID              : 1
Container Name                  : NV_QS1
RDS connection Entry ID         : 1
RDS connection Quota            : Unlimited
RDS connection Used Capacity    : 257.0 GiB
```

```
RDS connection Enabled          : Yes
RDS connection status           : Available
```

# connection --add

### Description

Adds a new connection to a container.

### Syntax

```
connection --add --name <name> --type <NFS|CIFS|OST|RDS|NDMP|ISCSI>
       [--clients <ip address>]
       [--dma <ip address>]
       [--initiator <IQN, ip address, hostname, or WWPN>]
       [--rootmap <nobody | root | administrator>]
       [--options <NFS | CIFS mount export options>]
       [--capacity <Positive decimal number>]
```

Where

```
--name        Name of container.
--type        Type of sharing required (NFS|CIFS|OST|RDS|NDMP|ISCSI).
--clients     Restrict NFS/CIFS access to this list of comma separated hosts.
--dma         Restrict NDMP access to this DMA host.
--initiator   Restrict ISCSI/FC access to this ISCSI/FC initiator.
--rootmap     How to map root for NFS.
--options     mount options NFS (rw,ro,insecure), CIFS(hide,unhide, sync
always=<yes/no>,valid users).
--capacity    OST usable capacity in Gigabytes.
```

### Result

```
Successfully added connection entry.
OST connection Quota            : 10
OST connection Enabled          : Yes
```

# connection --update

### Description

Updates or modifies the connection values on an existing container connection on a QoreStor. The **--capacity** command option lets you specify a positive decimal number to represent the capacity size (in Gigabytes (GB)) of an OST container.

**NOTE:** OST container connections are unlimited by default, and RDS type container connections only support unlimited capacity.

### Syntax

```
connection --update --name <name>
       --type <NFS|CIFS|OST|RDS|NDMP|ISCSI>
```

```
[--clients <ip address>]
[--dma <ip address>]
[--initiator <IQN, ip address, hostname, or WWPN>]
[--rootmap <nobody | root | administrator>]
[--options <NFS | CIFS mount export options>]
[--capacity <Positive decimal number>]
```

Where

```
--name        Name of container.
--type        Type of sharing required (NFS|CIFS|OST|RDS|NDMP|ISCSI).
--clients     Restrict NFS/CIFS access to this list of comma separated hosts.
--dma         Restrict NDMP access to this DMA host.
--initiator   Restrict ISCSI/FC access to this ISCSI/FC initiator.
--rootmap     How to map root for NFS.
--options     mount options NFS (rw,ro,insecure), CIFS(hide,unhide).
--capacity    OST usable capacity in Gigabytes.
```

### Result

```
Successfully updated connection entry.
OST connection Quota            : 200 GiB
OST connection Used Capacity    : 0.0 GiB
OST connection Enabled          : Yes
```

# connection --delete

### Description

Deletes an existing container connection.

### Syntax

```
connection --delete --name <name> --type <NFS|CIFS|OST|RDS|NDMP|ISCSI> [--clients
<ip address>]
```

Where

```
--name      Name of container.
--type      Type of sharing to remove (NFS|CIFS|OST|RDS|NDMP|ISCSI).
--clients   List of comma separated hosts.
```

### Result

```
Successfully deleted connection entry.
```

# connection --enable

### Description

Enables access to a container through a connection.

### Syntax

```
connection --enable --name <name> --type <NFS|CIFS|OST|RDS>
```

Where

```
--name   Name of container.
--type   Type of sharing (NFS|CIFS|OST|RDS).
```

### Result

```
Successfully updated connection entry.
RDS connection Quota            : Unlimited
RDS connection Used Capacity    : 257.0 GiB
RDS connection Enabled          : Yes
```

# connection --disable

### Description

Disables access to a container through a connection.

### Syntax

```
connection --disable --name <name> --type <NFS|CIFS|OST|RDS>
```

Where

```
--name   Name of container.
--type   Type of sharing (NFS|CIFS|OST|RDS).
```

### Result

```
Successfully updated connection entry.
OST connection Quota                                        : Unlimited
OST connection Used Capacity   : 5.0 GB
OST connection Enabled                                      : No
```

# connection --help

### Description

Displays the listing of user and related options that you can use as a reference when using the QoreStor CLI.

### Syntax

```
connection --help
```

## Results

```
Usage:
       connection --show
               [--name <name>]
```

```
                [--type <NFS|CIFS|OST|RDS|NDMP|ISCSI>]
                [--verbose]

        connection --add --name <name>
                --type <NFS|CIFS|OST|RDS|NDMP|ISCSI>
                [--clients <ip address>]
                [--dma <ip address>]
                [--initiator <IQN, ip address, hostname, or WWPN>]
                [--rootmap <nobody | root | administrator>]
                [--options mount options NFS (rw,ro,insecure), CIFS(hide,unhide,sync
always=<yes/no>,valid users)]
                [--capacity <Positive decimal number>]

        connection --update --name <name>
                --type <NFS|CIFS|OST|RDS|NDMP|ISCSI>
                [--clients <ip address>]
                [--dma <ip address>]
                [--initiator <IQN, ip address, hostname, or WWPN>]
                [--rootmap <nobody | root | administrator>]
                [--options <NFS | CIFS mount export options>]
                [--capacity <Positive decimal number>]

        connection --delete --name <name>
                --type <NFS|CIFS|OST|RDS|NDMP|ISCSI>
                [--clients <ip address>]

        connection --enable --name <name>
                --type <NFS|CIFS|OST|RDS>

        connection --disable --name <name>
                --type <NFS|CIFS|OST|RDS>

        connection --help

        connection <command> <command-arguments>
        <command> can be one of:
                --show      Displays the current connections on a container.
                --add       Adds a new connection to a container.
                --update    Updates an existing connection.
                --delete    Deletes an existing connection.
                --enable    Enables access to a container through a connection.
                --disable   Disables access to a container through a connection.

        For command-specific help, please type connection --help <command>
        eg:
        connection --help show
```

# Container

This topic introduces the set of QoreStor CLI commands that allow you to perform the following tasks:

- Display the status of all current containers (summary or detail)
- Create (and name) new containers
- Delete existing containers

# Container Command Usage

This topic introduces the **container** command usage:

- **container --show [options]**
- **container --add --name [options]**
- **container --update [options]**
- **container --delete --name [options]**
- **container --marker --name <name> [--enable options] [--disable options]**
- **container --cloud_policy [options]**
- **container --delete_files --name <name>**
- **container --add_uac [options]**
- **container --delete_uac [options]**
- **container --update_uac [options]**
- **container --show_uac [options]**
- **container --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

## container --show

Displays the current list of containers.

### Syntax

```
container --show [--name <name>] [--verbose]
```

Where

```
--name      Display details for a specific container.
--verbose   Display more details.
```

### Result

```
container --show --name vRanger_FastContainer's Group ID                    : 2
Container's Group Name                    : tool-load
```

```
Container Name                          : QSPL-4300-13_OST
Container Path                          : /containers/QSPL-4300-13_OST
Container Object Direct Storage         : No
Container Cloud Replication             : None
Container Marker                        : None
Recycle Bin Enabled                     : No
OST connection Quota                    : Unlimited
OST connection Used Capacity            : 758222.0 GiB
OST connection Enabled                  : Yes
OST connection status                   : Available
Number of container UACs                : 1
```

### Other Examples

Displays the detailed status of an existing container that you specify by name using the **container --show --name --verbose** command:

```
Container Entry ID                      : 6
Container's Group ID                    : 2
Container's Group Name                  : tool-load
Container Name                          : QSPL-4300-13_OST
Container Path                          : /containers/QSPL-4300-13_OST
Container Object Direct Storage         : No
Container Cloud Replication             : None
Container Marker                        : None
Container Created On                    : Tue Jun 26 11:56:43 2018 EDT
Container Created Ver                   : 4.1.0.235
Container Created Bld                   : 1082C
Recycle Bin Enabled                     : No
OST connection Entry ID                 : 5
OST connection Quota                    : Unlimited
OST connection Used Capacity            : 758222.0 GiB
OST connection Enabled                  : Yes
OST connection status                   : Available
Number of container UACs                : 1
user: backup_user,      user_id: 1,     access: RWD
```

# container --add

### Description

Creates and names a new container in QoreStor.

**NOTE:** If a storage group name is not provided, the container will be placed in Default Group.

**NOTE:** Container names and storage group names cannot exceed 32 characters in length. Container names cannot start with a number, and the /, #, and @ special characters are not allowed. Valid values for the container and storage group name are [a-z, A-Z, 0–9, and '_'.

### Syntax

```
container --add --name <name>
       [--type <VTL>]
       [--tape_size <800GB|400GB|200GB|100GB|50GB|10GB>]
       [--no_of_drives <1-60>]
       [--is_oem <yes|no>]
       [--oem_vendor <QUEST>]
       [--group_name <name>]
```

Where

```
--name           Name of the container. Valid values are  [a-z,A-Z,0-9,'-' and '_'
for non-VTL containers]  and maximum of 32 characters.
--type           Type of the container.
--tape_size      Tape size <800GB|400GB|200GB|100GB|50GB|10GB>
--no_of_drives   Number of Drives (applicable to FC containers only)
--is_oem         Is OEM <yes|no>
--oem_vendor     oem_vendor <QUEST>
--group_name     Name of the storage group. Valid values are [a-z,A-Z,0-9,'-' and '_
'] and maximum of 32 characters.
```

### Result

```
Container "acme99" created successfully.
```

## container --update

### Description

Updates the specified container.

### Syntax

```
container --update --name <name>
       [--no_of_drives <1-60>]
       [--cloud_replication <yes|no>]
       [--immutable_file_stat]
```

Where

```
--name                  Name of the container. Valid values are  [a-z,A-Z,0-9,'-'
and '_' for non-VTL containers]  and maximum of 32 characters.
--no_of_drives          Number of Drives (applicable to FC containers only)
--cloud_replication     <yes|no>
--immutable_file_stat   Updates immutable file stat
```

### Result

```
The FC service will be restarted for this change to take effect, Do you want to
continue? (yes/no) [n]? y
Successfully updated Container FC1's number of drives as 32.
```

# container --delete

### Description

Deletes the files and the existing container on which the files reside in a QoreStor when using the **--name** option with **--delete_files** command.

### Syntax

```
container --delete --name <name> [--delete_files]
```

Where

```
--name           Name of container.
--delete_files   Deletes the files in the container.
```

### Result

```
WARNING: All the data in the container acme4 will be deleted!

Do you want to continue? (yes/no) [n]? y
Please enter the administrator password:
Container "default_ost" marked for deletion. Please run "maintenance --filesystem --
reclaim_space" to recover the storage space.
```

**NOTE:** Be aware that it may take a fair amount of time for the QoreStor file and container deletion processes to complete and update the system status. For details on deleting the files within an OST container, see container --delete_files.

# container --marker

### Description

Enables or disables a marker type or an automatic marker setting type (Auto) on an existing container in the QoreStor. To enable or disable the automatic marker setting type on an existing container, substitute **Auto** in place of a specific marker type (for example, Networker in the CLI command.

### Syntax

```
container --marker [--enable <Auto|CommVault|Networker|TSM|ARCserve|HP_
DataProtector|Unix_Dump|BridgeHead|TiNa|Acronis>]
       [--disable <Auto|CommVault|Networker|TSM|ARCserve|HP_DataProtector|Unix_
Dump|BridgeHead|TiNa|Acronis>]
       --name          <name>
```

Where

```
--enable        Enable marker of given type.
--disable       Disable marker of given type.
--name          Name of container.
```

### Result

```
Marker updated successfully.
```

## Other Examples

Disables a Networker marker on an existing container in the QoreStor:

```
container --marker --disable networker --name acme99
Marker updated successfully.
```

# container --cloud_policy

### Description

Cloud policy for a replication primary container.

### Syntax

```
container --cloud_policy [--age_of_file <1 hours to 70 years (in hours)>]
       [--incl_file_ext <file extension list>]
       [--excl_file_ext <file extension list>]
       [--incl_file_regex <file regex pattern>]
       [--excl_file_regex <file regex pattern>]
       [--incl_dir <include directory list>]
       [--excl_dir <exclude directory list>]
       [--stub_excl_dir <exclude directory list>]
       [--stub_excl_file_regex <file regex pattern>]
       [--stub_excl_file_ext <file extension list>]
       [--on_prem_reten_age <1 hours to 70 years (in hours)>]
       [--reset <incl_file_ext|incl_file_regex|excl_file_ext|excl_file_regex|incl_
dir|excl_dir|stub_excl_dir|stub_excl_file_ext|stub_excl_file_regex>]

--name <name>
```

Where:

```
--stub_excl_dir          Comma separated list of directories in which files under
those directories that should be excluded from stubbing. (Ex: /excl_dir1/,.excl_
dir2))
--stub_excl_file_regex   | separated list of regular expressions skips the files to
be stubbed.(Ex: .jpg|.gz)
--stub_excl_file_ext     Comma separated list of file extensions of files to be
excluded from stubbing.(Ex: .jpg,.gz)
--reset                  reset incl_file_ext, excl_file_ext, incl_dir excl_dir.
stub_excl_dir, stub_excl_file_ext or stub_excl_file
```

# container --delete_files

## Description

Deletes only the data files in a container, and leaves the container intact.

### Syntax

```
container --delete_files --name <name>
```

Where

```
--name   Container Name
```

### Result

```
Error: Connection needs to be disabled first.
```

**NOTE:** This command is only supported on OST/RDA connection type containers and the connection to the container must be disabled before you can delete its files. For details, see connection --disable . To delete the files and the existing OST container on which the files resides, see container --delete.

# container --add_uac

### Description

Add user access control (UAC) to an OST or RDS container. Mode is [RW | RWD].

**NOTE:** Only OST and RDA users can have access controls. Adding UAC commands applies only to RDS and OST containers.

### Syntax

```
container --add_uac --name <name> --user <user name> --mode <RW|RWD>
```

```
Where

--name   Name of container.
--user   Name of the user.
--mode   Access permissions for the user: {RW | RWD}
```

### Result

Successfully updated container with uac for user "<user name>".

# container --delete_uac

### Description

Delete user access control to the container.

### Syntax

```
container --delete_uac --name <name>  --user <user name>
```

Where

```
--name   Name of container.
--user   Name of the user.
```

### Result

Successfully deleted uac for user "<user>" from the container

## container --update_uac

### Description

Update user access control to the container. Mode is [RW | RWD]

### Syntax

```
container --update_uac --name <name> --user <user name> --mode <RW|RWD>
```

Where

```
--name   Name of container.
--user   Name of the user.
--mode   Access permissions for the user: {RW | RWD}
```

### Result

Successfully updated container with uac for user "<user>"

## container --show_uac

### Description

Show user access controls of all users (or just specified user) of the container.

### Syntax

```
container --show_uac [--name <name>] [--user <user name>]
```

Where:

```
--name   Name of container.
--user   Name of the user.
```

### Result

The UAC configuration will be displayed.

```
container: <name>, user: <user>, user_id: 6, access: RW
```

# container --help

### Description

Displays the list of container-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
container --help
```

### Result

```
container --show
       [--name <name>]
       [--verbose]

container --add --name <name>
       [--type <NFS|CIFS|OST|RDS>]

       --user <user name>
       --mode <RW|RWD>

container --delete_uac --name <name>
       --user <user name>

container --update_uac --name <name>
       --user <user name>
       --mode <RW|RWD>

container --show_uac
       [--name <name>]
       [--user <user name>]

container --help

container <command> <command-arguments>
<command> can be one of:
       --show           Displays the current list of containers.
       --add            Adds a new container.
       --update         Updates a container.
       --delete         Deletes an existing container.
       --recycle_bin    Recycle bin for an existing container.
       --marker         Enables/Disables marker for an existing container.
       --cloud_policy   Cloud policy for a replication primary container.
       --delete_files   Deletes the files in the container.
       --add_uac        Add user access control to the container. Mode is [RW | RWD]
       --delete_uac     Delete user access control to the container.
       --update_uac     Update user access control to the container. Mode is [RW | RWD]
       --show_uac       Show user access controls of all users (or just specified user) of
the container.

For command-specific help, please type container --help <command>
eg:
```

```
container --help show

container --recycle_bin [--enable <--rb_retention_period <7 days to 30 days>>]
       [--update <--rb_retention_period <7 days to 30 days>>]
       [--restore <[--start_time "YYYY-MM-DD HH:MM:SS"] [--end_time "YYYY-MM-DD
HH:MM:SS"]>]
       [--file_list <[--start_time "YYYY-MM-DD HH:MM:SS"] [--end_time "YYYY-MM-DD
HH:MM:SS"]>]
       [--view_file_list]
       [--view_restored_times]
       [--view_restored_files <[--time "YYYY-MM-DD HH:MM:SS"]>]
       --name <name>
```

# iSCSI

The iSCSI commands allow you to manage iSCSI connections when you are using virtual tape library (VTL) containers.

# ISCSI Command Usage

This topic introduces the QoreStor CLI commands that allow you to manage iSCSI connections when you are using virtual tape library (VTL) containers. These commands include:

- **iscsi --show**
- **iscsi --setpassword**
- **iscsi --sessions**
- **iscsi --help**

## iscsi --show

### Description

This command displays iSCSI information including the iSCSI CHAP user name in the current QoreStor system.

### Syntax

```
iscsi --show [--user]
```

Where

```
--user   Show CHAP user name
```

### Result

```
user : iscsi_user
```

### Syntax

```
iscsi --show
```

### Result

```
Target 1 :
    System information:
        Driver: iscsi
        State: ready
    I_T nexus information:
    LUN information:
        LUN: 0
            Type: controller (Controller)
            Backing store path: None
        LUN: 1
            Type: passthrough (L700)
            Backing store path: /dev/sg12
        LUN: 2
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg2
        LUN: 3
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg8
        LUN: 4
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg11
        LUN: 5
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg4
        LUN: 6
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg5
        LUN: 7
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg6
        LUN: 8
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg10
        LUN: 9
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg3
        LUN: 10
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg9
        LUN: 11
            Type: passthrough ( ULT3580-TD4)
            Backing store path: /dev/sg7
    Account information:
        iscsi_user
    Target 1 ACL information:         10.250.249.221
administrator@satyan-vm1 >
```

# iscsi --setpassword

### Description

This command sets the password for the iSCSI CHAP user.

### Syntax

```
iscsi --setpassword
```

### Result

```
WARNING: All existing iSCSI sessions will be terminated!
Do you want to continue? (yes/no) [n]? yes
Enter new CHAP password:
Re-type CHAP password:
administrator@test-vm1 >
```

# iscsi --sessions

### Description

This command displays the current iSCSI sessions in the current DR system.

### Syntax

```
iscsi --sessions
```

### Result

```
 iSCSI client(s) information:
 Container: test_vtl
   Target IQN:
     Initiators Connected: iqn.1991-05.com.microsoft:win-
t16n70kqii4.testad.test.local
```

# iscsi --help

### Description

Displays the list of iSCSI-related command options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
iscsi --help
```

### Result

```
Usage:
iscsi --show [--user]
iscsi --setpassword
```

```
iscsi --sessions
iscsi --help

command> <command-arguments>
<command> can be one of:
--show          Displays command specific information.
--setpassword   Set CHAP password
--sessions      Show iSCSI sessions

For command-specific help, please type iscsi --help <command>
eg:
iscsi --help show
```

# NDMP

The NDMP commands allow you to manage NDMP connections when you are using virtual tape library (VTL) containers.

# NDMP Command Usage

This topic introduces the QoreStor CLI commands that allow you to manage NDMP connections when you are using virtual tape library (VTL) containers. These commands include:

- **ndmp --show**
- **ndmp --update [options]**
- **ndmp --help**

## ndmp --show

### Description

This command displays the NDMP username and port number being used in the current QoreStor system.

### Syntax

```
ndmp --show
```

### Result

```
# ndmp --show
NDMP User: ndmp_user
NDMP Port: 10000
```

## ndmp --update

### Description

This command allows you to update and set the port number of the NDMP server. (The default port is 10000.)

### Syntax

```
ndmp --update [--port <number>]
```

Where

```
--port   Set the port number of NDMP server.
```

### Result

```
WARNING: Updating NDMP port involves restarting NDMP services.
Do you want to continue (yes/no) [n]? y
Successfully updated NDMP to use port 10001.
Restarting NDMP service ... done.
```

## ndmp --help

### Description

Displays the list of NDMP-related command options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
ndmp --help
```

### Result

```
Usage:

ndmp --show
ndmp --update
ndmp --help

ndmp <command> <command-arguments>
<command> can be one of:
--show   Displays command specific information.

For command-specific help, please type ndmp --help <command>

eg:
ndmp --help show
```

# Object_container

This topic introduces the set of QoreStor CLI commands that allow you to manage, configure, and display connection-related settings for object containers on a QoreStor server.

# object_container command usage

This topic introduces the **object_container** command usage:

- **object_container --show [options]**
- **object_container --add [options]**
- **object_container --update [options]**
- **object_container --encryption [options]**
- **object_container --delete_data**
- **object_container --delete**
- **object_container --setpassphrase**
- **object_container --bucket [options]**
- **object_container --policy [options]**
- **object_container --help**

# object_container --show

### Description

Displays the current list of object_container.

### Syntax

```
object_container --show [--verbose]
       [--endpoint]
```

Where

```
--verbose       Display more details.
--endpoint     Display Object container service endpoint.
```

### Result

```
Storage_group  Name                                  :  ObjectStorageGroup
Storage_group  Compression  Type                 :  Fast
Storage_group  Encryption  Set                   :  Off
Storage_group  Encryption  Type                  :  Off
Storage_group  Rotate  Period                    :  0
Storage_group  Passphrase  set                   :  No
Storage_group  Quota  limit                      :  Unlimited
ObjectStorageGroup's  Containers
-------------------------------
ObjectContainer
```

# object_container --add

### Description

Adds a new object container

### Syntax

```
object_container --add [--quota <Quota value in GiB or TiB>][--use_http <yes|no>]
```

Where

```
--quota        Quota value in GiB or TiB.
--use_http     <yes|no>
```

### Result

```
Container "ObjectContainer" created successfully.
Successfully added connection entry.
OBJECT connection Enabled                 : Yes
Adding object role to backup_user user...Done.
Creating default bucket: default-bucket...Done.
Object container created successfully.
```

# object_container --update

### Description

Updates an existing object container

### Syntax

```
object_container --update [--quota <Quota value in GiB or TiB>] [--use http
<yes|no>]
```

Where

```
--quota          Quota value in GiB or TiB.
--use_http      <yes|no>
```

### Result

```
Storage Group "ObjectStorageGroup" updated successfully.
```

# object_container --encryption

### Description

Updates encryption settings of an object container.

### Syntax

```
object_container --encryption [--set <ON | OFF>] [--mode < static | internal >] [--
interval <7 days to 70 years>]
```

Where

```
--set        Valid values are On and Off.

--mode       Valid values are static and internal.

--interval   Valid values are between 7 days to 70 years (in days).
```

### Result

```
Storage Group "ObjectStorageGroup" updated successfully.
```

## object_container --delete_data

### Description

Deletes object_container and its data.

### Syntax

object_container --delete_data

### Result

```
WARNING: All the data in the container ObjectStorageGroup will be deleted!
 Do you want to continue? (yes/no) [n]? y
 Please enter the root password:
 Container "ObjectContainer" marked for deletion. Please run "maintenance --
filesystem --reclaim_space" to recover the storage space.
 Cleaning up local namespace lock files. Please wait...Done.
```

## object_container --delete

### Description

Deletes an existing object_container.

### Syntax

object_container --delete

### Result

```
WARNING: All the data in the container ObjectStorageGroup will be deleted!
Do you want to continue? (yes/no) [n]? y
Please enter the root password:
Storage Group "ObjectStorageGroup" has been deleted.
```

```
Object Storage Group deleted.
```

# object_container --setpassphrase

### Description

Sets passphrase to an object container.

### Syntax

```
object_container --setpassphrase
```

### Result

```
Enter current passphrase:
Enter new passphrase:
Re-type passphrase:
Storage Group "ObjectContainer" updated successfully.
Passphrase updated successfully.
```

# object_container --bucket

### Description

Create, delete, or list buckets in an object container.

### Syntax

```
object_container --bucket [--create][--enable-object-lock] [--name <bucket name>][--
delete] [--name <bucket name>][--set-lock] [--name <bucket name>] [--mode
<compliance|governance|none>]

        [--valid-days <1 to 36500 days>] [--valid-years <1 to 100 years>][--set-retention]
[--name <bucket name>] [--retention-mode <compliance|governance>]

        [--valid-days <1 to 36500 days>] [--valid-years <1 to 100 years>] [--object-prefix
<anything>][--show] [--name <bucket name>][--list]
```

Where

```
--create               Creates a bucket.

--delete               Deletes a bucket.

--enable-object-lock   enable object locking

--set-lock             Set object lock configuration for a bucket.

--set-retention        Set object retention for objects with a given prefix.

--show                 Show the given bucket details.

--name                 bucket name
```

```
--mode                  Object lock configuration mode for a bucket. Valid values are
"Compliance" or "Governance".

--retention-mode        Object lock configuration retention mode for an object
prefix. Valid values are "Compliance" or "Governance".

--valid-days            Object lock configuration validity for a bucket in days.

--valid-years           Object lock configuration validity for a bucket in years.

--object-prefix         Object prefix to set retention

--list                  list all buckets.
```

### Result

```
> object_container --bucket --create --name testbucket

Successfully created bucket: teststbucket.
```

## object_container --policy

### Description

Set or show policy of an object container.

### Syntax

```
object_container --policy [--set] [--policy_type <readonly|readwrite|none>] --name
<user name> [--show] --name <user name>
```

Where

```
--set           Set a policy to the user.

--show          Show a policy to the user.

--policy_type   Valid values are "readonly" or "readwrite" or "none".

--name          user name
```

### Result

```
> object_container --policy --show --name backup_user

Object container user policy: readwrite
```

## object_container --help

### Description

Displays the list o**f object_container** related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
object_container --help
```

### Result

```
object_container --show [--verbose]
       [--endpoint]

object_container --add [--quota <Quota value in GiB or TiB>] [--use_http <yes|no>]

object_container --update [--quota <Quota value in GiB or TiB>] [--use_http
<yes|no>]

object_container --encryption [--set <ON | OFF>]
       [--mode < static | internal >]
       [--interval <7 days to 70 years>]

object_container --delete_data

object_container --delete

object_container --setpassphrase

object_container --bucket [--create] [--set-lock] [--set-retention] [--show] [--
list] [--enable-object-lock] [--name <bucket name>] [--delete] [--name <bucket
name>] [--name <bucket name>] [--mode <compliance|governance|none>] [--valid-days <1
to 36500 days>] [--valid-years <1 to 100 years>] [--name <bucket name>] [--
retention-mode <compliance|governance>] [--valid-days <1 to 36500 days>] [--valid-
years <1 to 100 years>] [--object-prefix <anything>] [--name <bucket name>]

object_container --policy [--set] [--policy_type <readonly|readwrite|none>] --name
<user name>
       [--show] --name <user name>

object_container --help

object_container <command> <command-arguments>

<command> can be one of:
       --show            Displays the current list of object_container.
       --add             Adds a new object_container.
       --update          updates an object_container.
       --encryption      updates encryption settings of an object_container.
       --delete_data     Deletes object_container container and its data.
       --delete          Deletes an existing object_container.
       --setpassphrase   sets passphrase to an object_container.
       --bucket          Create, delete or list buckets in an object_container.
       --policy          Set or show policy of object_container user.
For command-specific help, please type object_container --help <command>
       eg:
       object_container --help show
```

# Object_direct

This topic introduces the set of QoreStor CLI commands that allow you to manage and display object direct settings for a QoreStor server.

# object_direct command usage

This topic introduces the **object_direct** command usage:

- **object_direct --show [options]**
- **object_direct --update [options]**
- **object_direct --update_sentinal**
- **object_direct --help**

## object_direct --show

### Description

Displays the current list of **object_direct** connection details

### Syntax

```
object_direct --show
```

### Result

```
Object_direct:
Cloud provider name    :AZURE
Cloud container name   :od-azure-container
```

## object_direct --update_sentinel

### Description

Updates Object Direct cloud connection details and creates sentinel in the given cloud bucket. This command should be used when the cloud connection fails during QoreStor installation in Object Direct mode, which takes the system to Manual Intervention mode.

The cloud provider name and cloud container or bucket name are to be passed as arguments. The command prompts for connection string. QoreStor comes to Operational mode after successful completion of the command.

### Syntax

```
object_direct --update_sentinel --cloud_container <bucket name> --cloud_provider <
(missing or bad snippet)>
```

Where

```
--cloud_container   Name of the cloud container. Valid values are [a-z,0-9,'-','.'].
--cloud_provider    Name of the cloud service provider. Valid values are [<AWS-
S3|AZURE|Wasabi-S3|Google-S3|IBM-S3|S3-Compatible>].
```

### Result

```
Enter AZURE cloud connection string to connect to container <container>: (
connection string here )
```

```
Checking if container [<container>] is empty...
Container empty test pass. Container [<container>] in the cloud is empty.
Connection credentials validated successfully.
Object Direct Connection updated successful. Restarting the filesystem service.

Filesystem service re-started successfully.
```

# object_direct --update

### Description

Updates Object Direct cloud connection details. This command can be used to change the connection string, for example to change the secret key or to change the protocol for cloud connection (http or https). Command prompts for the connection string.

The cloud provider or the cloud bucket cannot be changed

### Syntax

```
object_direct --update
```

### Result

```
Enter Google-S3 cloud connection string to connect to container <container>:
```

# object_direct --help

### Description

Displays the list of **object_direct** related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
object_direct --help
```

### Result

```
object_direct --show

object_direct --update_sentinel --cloud_container <bucket name> --cloud_provider <
(missing or bad snippet)>

object_direct --update
```

```
object_direct --help

object_direct <command> <command-arguments>

<command> can be one of:
       --show            Displays the current list of object_direct.
       --update_sentinel Updates an object direct cloud connection details and creates
sentinel.
       --update          Updates an object direct cloud connection details.

For command-specific help, please type object_direct --help <command>
       eg:
       object_direct --help show
```

# Performance_tier

This topic introduces the set of QoreStor CLI commands that allow you to manage, configure, and display connection-related settings for performance tiers on a QoreStor server. For more information, see Container Command Usage .

# Performance_tier command usage

This topic introduces the **performance_tier** command usage:

- **performance_tier --show [options]**
- **performanc_tier --add [options]**
- **performance_tier --update [options]**
- **performance_tier --encryption [options]**
- **performance_tier --setpassphrase**
- **performance_tier --test-iops [options]**
- **performance_tier --help**

## performance_tier --show

### Description

Displays the details of PerformanceTier storage_group.

### Syntax

```
performance_tier --show [--verbose]
```

Where

```
--verbose   Display more details.
```

### Result

```
Storage_group  Name                        :  PerformanceTier
 Storage_group  Compression  Type    :  Fast
 Storage_group  Encryption  Set       :  On
 Storage_group  Encryption  Type     :  Static
 Storage_group  Rotate  Period        :  30
 Storage_group  Passphrase  set       :  Yes
 Storage_group  Mapped  Enclosure    :  /test01
 Storage_group  Quota  limit           :  Unlimited
 PerformanceTier's  Containers
 ---------------------------
 test123
 rdacont
```

# performance_tier --add

### Description

Adds a new performance tier.

### Syntax

```
performance_tier --add --path <enclosure filesystem dir> [--compression_mode
<fast|best>][--quota <Quota value in GiB or TiB>]
```

Where

```
--path               Absolute directory path for exclusively mapped enclosure.
--compression_mode   Valid values are Fast and Best.
--quota              Quota value in GiB or TiB.
```

### Result

```
Running IOPS tests on /QS_perftier, takes few minutes
Sequential and Random IOPS tests passsed on /QS_perftier

WARNING: IO will be stopped during storage addition.

Do you want to continue (yes/no) [n]? y
Storage Group "PerformanceTier" created successfully.
SG map added to DB successfully. Now issuing storage expansion CLI
It may take a few minutes to restart the operations ...
```

# performance_tier --update

### Description

Updates a performance tier.

### Syntax

```
performance_tier --update --compression_mode <fast|best> [--quota <Quota value in GiB or TiB>]
```

Where

```
--compression_mode   Valid values are Fast and Best.

--quota              Quota value in GiB or TiB.
```

### Result

```
Storage Group "PerformanceTier" updated successfully.
```

## performance_tier --encryption

### Description

Updates encryption settings of a performance tier.

### Syntax

```
performance_tier --encryption [--set <ON | OFF>] [--mode < static | internal >] [--interval <7 days to 70 years>]
```

Where

```
--set        Valid values are On and Off.

--mode       Valid values are static and internal.

--interval   Valid values are between 7 days to 70 years (in days).
```

### Result

```
Storage Group "PerformanceTier" updated successfully.
```

## performance_tier --setpassphrase

### Description

Sets passphrase to a performance tier.

### Syntax

```
performance_tier --setpassphrase
```

### Result

```
Enter current passphrase:
Enter new passphrase:
Re-type passphrase:
```

```
Storage Group "PerformanceTier" updated successfully.
Passphrase updated successfully.
```

# performance_tier --test-iops

### Description

Run IOPS tests on performance tier.

### Syntax

```
performance_tier --test-iops --path <enclosure filesystem dir>
```

Where

```
--path   Path to the data storage.
```

### Result

```
Running IOPS tests on /test01, takes few minutes
Sequential and Random IOPS tests passsed on /test01
Running IOPS tests on /test01, takes few minutes
Sequential min required IOPS: 2000
Sequential current IOPS: 72990
Random min required IOPS: 850
Random current IOPS: 1464
Sequential and Random IOPS tests passsed on /test01
Total Capacity bytes: 966053068800
Total Free bytes: 966019186688
```

# performance_tier --help

### Description

Displays the list of **performance_tier** related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
performance_tier --help
```

### Result

```
performance_tier --show [--verbose]

performance_tier --add --path <enclosure filesystem dir>
               [--compression_mode <fast|best>]
               [--quota <Quota value in GiB or TiB>]

performance_tier --update --compression_mode <fast|best>
               [--quota <Quota value in GiB or TiB>]

performance_tier --encryption [--set <ON | OFF>]
```

```
                [--mode < static | internal >]
                [--interval <7 days to 70 years>]

performance_tier --setpassphrase

performance_tier --test-iops --path <enclosure filesystem dir>

performance_tier --help

performance_tier <command> <command-arguments>
<command> can be one of:
       --show            Displays the details of PerformanceTier storage_group.
       --add             Adds a new performance tier.
       --update          Updates a performance tier.
       --encryption      Updates encryption settings of a performance tier.
       --setpassphrase   Sets passphrase to a performance tier.
       --test-iops       Run IOPS tests on performance tier.

For command-specific help, please type performance_tier --help <command>
       eg:
       performance_tier --help show
```

# Replication

To allow QoreStor replication operations, ensure that TCP ports 9904, 9911, 9915, and 9916 are enabled. For more information about supported ports for the QoreStor, see the *QoreStor Administrator Guide*.

The Replication QoreStor CLI command and its options allow you to manage the status of all current replication relationships and tasks on a system by:

- Displaying the current replication process status information
- Creating and defining new replication links or relationships to containers
- Deleting specific replication links
- Starting and stopping the replication process between source and target containers
- Limiting the bandwidth consumed during replication
- Resynchronizing replication between source and target containers
- Troubleshooting replication connection issues

**NOTE:** You can set a replication schedule for daily replication operations. For details, see schedule --add --day <day of the week> [--start_time <hh:mm>] [-- stop_time <hh:mm>] [--cleaner] [--replication].

# Replication Command Usage

This topic introduces the **replication** command usage:

- **replication --show [options]**
- **replication --add --name --role --peer [options]**

- **replication --update --name --role --peer [options]**
- **replication --delete --name --role [options]**
- **replication --start --name --role [options]**
- **replication --stop --name --role [options]**
- **replication --limit --speed --target [options]**
- **replication --resync --name --role [options]**
- **replication --troubleshoot --peer**
- **replication --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

# replication --show

### Description

Displays the current status of all existing replication containers (and respective roles) in the QoreStor.

### Syntax

```
replication --show [--air]
       [--name <name>]
       [--role <source | target>]
       [--verbose]
       [--limits]
```

Where

```
--air       Auto Image replication enabled.
--name      Name of container.
--role      Role of container.
--verbose   Display more details.
--limits    Replication speed limits.
```

### Result

```
Container Name          Replication Role              Status
backup                  Source, Target                Enabled
acme-59                 Source                        Enabled
acmeStorage1            Source                        Enabled
acmeStorage2            Source                        Enabled
acmeStorage3            Target                        Enabled
```

# replication --add

### Description

Adds a new replication link to a container on the QoreStor, for which you need to define its name, role, peer IP address/hostname, peer name, peer group name, user name on the peer system, and encryption level to apply. The

peer group name is the name of the remote container's group to replicate to/from, and this parameter is applicable only if a remote container is not present.

There are three options for encryption:

- none,
- aes128 (Advanced Encryption Standard) which uses128-bit cryptographic keys
- aes256 (using 256-bit AES cryptographic keys).

If the username is a domain login (for example, domain\username), ensure that '\' characters and spaces are either escaped or in quotes.

**NOTE:** Make sure that the data container you intend to replicate already exists. If it does not, the following error message displays: *Error: Container <container_name> does not exist*.

### Syntax

```
replication --add --name <name>
       --role <source | target>
       --peer <ip address | hostname>
       [--peer_name <name>]
       [--peer_group_name <name>]
       [--replication_traffic <ip address | hostname>]
       [--encryption <none | aes128 | aes256>]
       [--username <user name>]
       [--air]
```

Where

```
--name                  Name of container to replicate.
--role                  Role of container.
--peer                  Peer appliance IP address/name of replication network
interface(s).
--peer_name             Name of remote container to/from replicate.
--peer_group_name       Name of remote container's group to/from replicate. Only
applicable if remote container is not present
--replication_traffic   IP address/name of local dedicated replication network
interface(s).
--encryption            Type of encryption to use on the wire.
--username              Username on peer system.
--air                  Auto Image replication enabled.
```

### Result

```
Enter password foradministrator@10.250.240.192:
Replication entry created successfully.
Replication Container          : backup
Replication Role               : Source
Replication Target             : 10.250.240.192
Replication Target IP          : 10.250.240.192
Replication Target Mgmt Name   : 10.250.240.192
Replication Target Mgmt IP     : 10.250.240.192
Replication Local Data Name    : QS2K-01
Replication Local Data IP      : 10.250.208.232
```

```
Replication Target Container   : backup
Replication Enabled            : Yes
Replication Compression Enabled: Yes
Replication Encryption         : AES 128-bit
```

**NOTE:** To verify that you have successful added a replication link to the QoreStor (or to view the current status of existing containers), see replication --show.

# replication --update

## Description

Updates an existing replication link to a container in a QoreStor and allows you to change the corresponding role, peer IP address or host name, the encryption being used, and user name based on the QoreStor CLI command options you specify.

## Syntax

```
replication --update --name <name>
       --role <source | target>
       [--peer <ip address | hostname>]
       [--replication_traffic <ip address | hostname>]
       [--encryption <none | aes128 | aes256>]
       [--username <user name>]
```

Where

```
--name                  Name of the replication container to update.
--role                  Current replication role of container.
--peer                  Peer appliance IP address/name of replication network
interface.
--replication_traffic   IP address/name of dedicated replication network interface.
--encryption            Type of encryption to use on the wire.
--username              Username on peer system.
```

## Result

**NOTE:** If you attempt to update a container that already has replication enabled, this displays the following message:

```
Replication on backup is enabled and cannot be updated, please stop it first.
```

When replication is enabled on the container, you must first disable it before you can update it. To disable replication on a container, enter the QoreStor CLI **replication --stop** command and define the container name and role:

```
replication --stop --name <name> --role <source | target>
```

**NOTE:** For more information about disabling replication, see replication --stop --name <name> --role <source | target>.

Disables replication on a container:

```
replication --stop --name backup --role source
Replication configuration updated successfully.
```

```
Replication Container           : backup
Replication Role                : Source
Replication Target System       : acme-85
Replication Target System IP    : 10.25.192.5
Replication Target Container    : acme85-S2
Replication Enabled             : No
Replication Compression Enabled : Yes
Replication Encryption          : AES 128-bit
```

# replication --delete

### Description

Deletes an existing replication link to a container in a QoreStor.

**NOTE:** It is recommended that the replication be in an INSYNC state for this operation. If replication is not in an INSYNC state, this operation can potentially take a much longer time to run.

### Syntax

```
replication --delete --name <name> --role <source | target> [--force]
```

Where

```
--name    Name of container.
--role    Role of container.
--force   Delete configuration even if peer container is unreachable. Replication
must be stopped first even with force option.
```

If you attempt to delete a container that already has replication enabled, this displays the following message:

```
Replication on acme-59-replica is enabled and cannot be deleted, please stop
it first.
```

**NOTE:** If the replication state of the link is enabled, you must use the replication --stop command to disable replication before you can delete the replication link. For more information, see replication --stop --name <name> --role <source | target>.

Deletes the existing replication link to a container.

```
replication --delete --name acme-59-replica --role source
```

### Result

```
Successfully deleted replication entry.
```

**NOTE:** The QoreStor CLI **--force** command is optional, and this command allows you to force the deletion of an existing replication link (such as when communications between the source and target are not working). Before using the **--force** option, replication must be stopped with the **replication --stop** command. For more information, see replication --stop --name <name> --role <source | target>

# replication --start

### Description

Starts the replication process on an existing replication link to a container in a QoreStor.

### Syntax

```
replication --start --name <name> --role <source | target>
```

Where

```
--name   Name of container.
--role   Role of container.
```

### Result

```
Replication configuration updated successfully.
Replication Container           : container2_replica
Replication Role                : Source
Replication Target System       : acme-85
Replication Target System IP    : 10.20.22.20
Replication Target Container    : acme85-S2
Replication Enabled             : Yes
Replication Compression Enabled : Yes
Replication Encryption          : AES 128-bit
```

# replication --stop

### Description

Stops the replication process on an existing replication link to a container in a QoreStor.

### Syntax

```
replication --stop --name <name> --role <source | target>
```

Where

```
--name   Name of container.
--role   Role of container.
```

### Result

```
Replication configuration updated successfully.
Replication Container           : acme59
Replication Role                : Source
Replication Target System       : acme-85
Replication Target System IP    : 10.20.22.20
Replication Target Container    : acme85-S2
Replication Enabled             : No
Replication Compression Enabled : Yes
Replication Encryption          : AES 128-bit
```

# replication --limit

### Description

Limits the bandwidth used during replication by defining a bandwidth limit using any of the following settings:

- Kilobytes/second (KBps)
- Megabytes/second (MBps)
- Gigabytes/second (GBps)
- Unlimited bandwidth (this is the default setting); minimum allowed bandwidth setting is 192 KBps

**IMPORTANT:** Bandwidth rules for all ports will be deleted. New rules will be applied by QoreStor with this command.

### Syntax

```
replication --limit --speed <<num><KBps|MBps|GBps> | default> --target <ip address |
hostname> [--air]
```

Where

```
--speed         Replication speed limit (eg. 10MBps).
--target       Replication peer IP address.
--air          Auto Image replication enabled.
```

### Result

```
Successfully updated replication limit for acme-60 to 10 GBps.
Changing traffic control policies ... done.
```

# replication --resync

### Description

Resynchronizes the replication process between a source and target container in a replication relationship on a QoreStor.

**IMPORTANT:** This command should only be used in an emergency situation with the help of Quest Support. Do not mistake this command as an ability to start a replication sync outside of the schedule window.

If your intention is to start a replication outside of the window, you can either delete the schedule, or add a temporary replication window to the current schedule and delete it when the systems are in sync.

### Syntax

```
replication --resync --name <name> --role <source | target>
```

Where

```
--name   Name of container.
--role   Role of container.
```

### Result

```
Successfully initiated replication resync on container dataStorage3.
```

# replication --troubleshoot

### Description

Troubleshoots the replication connections between a source and target container on a QoreStor.

> **NOTE:** This command only reports 9915 and 9916 as succeeding against a replication peer that has Qorestor or DR Series replication configured to another system. If the peer is not currently using any replication ports, 9915 and 9916 will report as connection refused.

### Syntax

```
replication --troubleshoot --peer <ip address | hostname>
```

Where

```
--peer   IP address or name of remote machine to troubleshoot.
```

### Result

The following examples shows both successful and unsuccessful replication connection attempts:

```
Testing connection to port 9904... Connected!
Testing connection to port 9911... Connected!
Testing connection to port 9915... Connected!
Testing connection to port 9916... Connected!
Replication troubleshooting completed successfully - Connection to all ports is OK!
```

```
replication --troubleshoot --peer acme-205
Testing connection to port 9904... Connected!
Testing connection to port 9911... Connected!
Testing connection to port 9915...
Unable to connect to socket - Connection refused
Could not connect to acme-205 on port 9915 - (Connection refused)
Testing connection to port 9916...
Unable to connect to socket - Connection refused
Could not connect to acme-205 on port 9916 - (Connection refused)
```

# replication --help

### Description

Displays the list of all replication-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
replication --help
```

### Result

```
Usage:

       replication --show [-air] [--name <name>]
               [--role <source | target>]
               [--verbose]
               [--limits]

       replication --add --name <name>
               --role <source | target>
               --peer <ip address | hostname>
               [--peer_name <name>]
               [--peer_group_name <name>]
               [--replication_traffic <ip address | hostname>]
               [--encryption <none | aes128 | aes256>]
               [--username <user name>]
               [-air]

       replication --update --name <name>
               --role <source | target>
               [--peer <ip address | hostname>]
               [--replication_traffic <ip address | hostname>]
               [--encryption <none | aes128 | aes256>]
               [--username <user name>]

       replication --delete --name <name>
               --role <source | target>
               [--force]

       replication --start --name <name>
               --role <source | target>

       replication --stop --name <name>
               --role <source | target>

       replication --limit --speed <<num><KBps|MBps|GBps> | default>
               --target <ip address | hostname>
               [-air]

       replication --resync --name <name>
               --role <source | target>

       replication --troubleshoot --peer <ip address | hostname>

       replication --help

replication <command> <command-arguments>
<command> can be one of:
       --show           Displays command specific information.
```

```
       --add            Adds a replication link to a container.
       --update         Updates a replication link to a container.
       --delete         Deletes a replication link from a container.
       --start          Starts replication.
       --stop           Stops replication.
       --limit          Delete existing bandwidth rules for all ports and set new
throttling limits.
       --resync         Initiates a replication re-sync.
       --troubleshoot   Troubleshoots replication connection.

For command-specific help, please type replication --help <command>
       eg:
       replication --help show
```

# Seed

The QoreStor seed operations allow for exporting data on the source to a portable seed device to then import the seed data to a primary target, and, if required, a secondary target as well. Replication seeding is an alternative to using network bandwidth for the initial re-synchronization of the source and target(s). After the target(s) are seeded, continuous replication can be started, which will keep the target(s) up to date by sending only unique data.

The QoreStor CLI seed commands support the following operations:

- Create a job to perform seeding export or import.
- Delete an existing seeding export or import job.
- Specify containers for seeding export.
- Remove a container which is already added for seeding export.
- Add a device to be used for seeding.
- Remove a device which is already added for seeding.
- Start seeding process (export/import).
- Stop running seeding process (export/import).
- Start cleaner to process seed ZL logs on target.

**NOTE:** The seeding device must be a CIFS share: a USB device connected to a Windows or Linux system and shared for import as a CIFS-mounted folder.

**NOTE:** The following scenarios are not supported for seeding:

- Import AND export from one share/device cannot occur at the same time.
- Import from one share/device cannot be completed from multiple locations at the same time.
- Export to a mount point can be completed only from one seed job. Multiple seed export jobs cannot send data to a single mount point.

# Seed Command Usage

This topic introduces the **seed** command usage:

- **seed --create --op <options> [--enc_type <options>] [--storage_group_name <name>]**
- **seed --delete**
- **seed --add_container --name <container name>**
- **seed --remove_container --name <container name>**
- **seed --add_device --server <server name> --volume <volume> --username <user name> --domain <domain name>**
- **seed --remove_device**
- **seed --start**
- **seed --stop**
- **seed --show**
- **seed --cleanup**
- **seed --help**

## seed --create

### Description

Creates a seed export job of type import or export on the source QoreStor or DR. The command will prompt for a password, and this password will be requested on the target to import the data. The command allows you to specify the type of encryption that will be used to encrypt the data on the seed device. The default value is aes256. The default value for storage group name is DefaultGroup.

### Syntax

```
seed --create --op <import|export> [--enc_type <aes128 | aes256>] [--storage_group_
name <name>]
```

Where

```
--op                    Seeding operation export/import.
--enc_type              Encryption type. Default value is aes256.
--storage_group_name    Storage group name. Default value is DefaultGroup
```

### Result

```
Enter password for seed export:
Re-enter password for seed export:
Successfully created seed job details.
```

# seed --add_container

### Description

Adds the container(s) that you want to seed. A new invocation of seed --add_container command needs to be run for every container that you want to seed.

### Syntax

```
seed --add_container --name <container name>
```

Where

```
--name   Seeding export container
```

### Result

```
Successfully added seed container.
```

# seed --add_device

### Description

Adds a target device to the job. This is a USB device, which is CIFS shared from a Windows or Linux system.

> **NOTE:** During seeding import, when a device is added to be used as target device, it can be used only for one job. To use it for another job, you need to delete all the seeding contents from the device. You can create separate folders on this device and can use each folder for a job.

### Syntax

```
seed --add_device --server <server name> --volume <volume> --username <user name> [-
-domain <domain name>]
```

Where

```
--server     CIFS Server to be used for importing / exporting data(IP address or
FQDN).
--volume     Volume in the CIFS share.
--username   Username of cifs server.
--domain     CIFS Server's domain.
```

### Result

```
Enter password for administrator@10.250.224.81:
Successfully added seed device.
```

# seed --cleanup

### Description

Starts the cleaner to remove data not referenced on the target.

**NOTE:** You should run the seeding cleaner only when the system is idle and no ingests or replications tasks are in progress. When the seeding cleaner is run during replication, for example, there is a chance of missing data during the seeding process. However, this data will eventually be sent during resync.

### Syntax

```
seed --cleanup
```

### Result

```
Successfully added seed ZL logs to cleaner queue
```

## seed --remove_device

### Description

Remove the target device. This is an important step without which stats and other information will not be saved on the target device.

### Syntax

```
seed --remove_device
```

### Result

```
Successfully deleted device details
```

## seed --show

### Description

Used to show the configured seed job.

### Syntax

```
seed --show
```

### Result

```
Device info
===========
Server                          :10.250.224.81

```

# seed --start

### Description

Starts the seeding job. You will be prompted to add additional devices if a single device does not have enough space.

### Syntax

```
seed --start
```

### Result

```
Successfully started seed job.
```

# seed --help

### Description

Displays the list of all seed command related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
seed --help
```

### Result

```
Usage:
     seed --create --op <import|export>
          [--enc_type <aes128 | aes256>]
          [--storage_group_name <name>]

     seed --delete

     seed --add_container --name <container name>

     seed --remove_container --name <container name>

     seed --add_device --server <server name>
          --volume <volume>
          --username <user name>
          [--domain <domain name>]

      seed --remove_device
      seed --start
      seed --stop
      seed --show
      seed --cleanup
```

```
      seed --help

 seed <command> <command-arguments>
     command can be one of:
          --create             Create a job to perform seeding export or import.
          --delete             Delete an existing seeding export or import job.
          --add_container      Add a container to be used for seeding export.
          --remove_container   Remove a container which is already added for seeding
export.
          --add_device         Add a device to be used for seeding.
          --remove_device      Remove a device which is already added for seeding.
          --start              Start seeding process(export/import).
          --stop               Stop running seeding process(export/import).
          --show               Show registered device, job for seeding.
          --cleanup            Start cleaner to process seed ZL logs on target.

  For command-specific help, please type seed --help <command>
      eg:
          seed --help create
```

# Schedule

A schedule is the means by which you set aside specific daily time periods for performing disk space reclamation or replication operations. Disk reclamation operations recover unused disk space from QoreStor containers in which files were deleted; replication operations are the process by which the key data is saved only once from multiple devices to minimize excessive or redundant storage of the same data.

This set of QoreStor CLI commands allow you to perform the following tasks on a system:

- Display existing scheduled Replication and Cleaner (disk space recovery) operations
- Create new schedules for Replication and Cleaner operations
- Delete existing scheduled Replication and Cleaner operations

# Schedule Command Usage

This topic introduces the **schedule** command usage:

- **schedule --show [--cleaner] [--replication] [--name]**
- **schedule --add --day <Day of the week (Sunday|Monday...)> [options]**
- **schedule --delete --day <Day of the week (Sunday|Monday...)> [options]**
- **schedule --help**

**NOTE:** If you specify a command without supplying the expected value or option, you will be prompted to provide the correct value or option.

# schedule --show

### Description

Displays any existing Cleaner schedule.

### Syntax

```
schedule --show [--cleaner]
                [--replication]
                [--cloudreplication]
                [--cloud_archive]
                [--name <name>]]
```

Where

```
--cleaner            Displays the cleaner schedule.
--replication        Displays all configured replication schedule(s).
--cloudreplication   Displays all configured cloud replication schedule(s).
--cloud_archive      This is used for cloud_replication. It sets cloud tier by
default. For archive tier, use --cloud_archive.
--name               Display replication schedule of a specific container.
```

### Result

```
Cleaner Schedule:
                      Start   Stop
Sunday                05:00   06:00
Monday                05:00   06:00
Tuesday               05:00   06:00
Wednesday             05:00   06:00
Thursday              05:00   06:00
Friday                05:00   06:00
Saturday              05:00   06:00
```

# schedule --add

### Description

Creates a new Cleaner or Replication schedule for a QoreStor instance.

**NOTE:** Without any Cleaner schedule set, the QoreStor Cleaner process automatically starts within two minutes after it detects that no data ingest operation or other system operation activity is present. So, if your QoreStor runs intermittent or inconsistent ingest or readback, or replication operations, there is no need to set a Cleaner schedule (it will automatically run during periods of low or non-activity). However, if your system runs regular and consistent ingest or readback you should create a Cleaner schedule that runs only during a known period of low or non-activity (for example, on a day or time period sufficient to complete this process). If your system does not meet either of these cases, you can still manually run the Cleaner. For more information, see maintenance --filesystem [--reclaim_space].

### Syntax

```
schedule --add --day <Day of the week (Sunday|Monday...)>
       [--cleaner]
       [--replication]
       [--cloudreplication]
       [--start_time <HH:MM>]
       [--stop_time <HH:MM>]
       [--name <name>]
       [--cloud_archive]
```

Where

```
--day                Day of the week to add.
--cleaner            Set up a cleaner schedule.
--replication        Set up a replication schedule.
--cloudreplication   Set up a cloud replication schedule.
--start_time         Schedule start time in HH:MM format, 00:00 - 23:59 are valid
values. To disable or continue from previous day, use -:- for start time.
--stop_time          Schedule stop time in HH:MM format, 00:01 - 24:00 are valid
values. To continue to next day, use -:- for stop time.
--name               Replication source Container Name.
--cloud_archive      This is used for cloud_replication. It sets cloud tier by
default. For archive tier, use --cloud_archive.
```

**NOTE:** Set a corresponding stop time for every start time in each Cleaner (or Replication) schedule you create.

**NOTE:** Do not select 00:00 for a start time or stop time endpoint for midnight when setting Cleaner or Replication schedules (instead, use either the 23:55 or 00:05 value).

### Result

```
Successfully updated Cleaner schedule.
```

**NOTE:** To create a Replication schedule (use the QoreStor CLI **--replication** command), and the same process shown here to schedule the start and stop times for a Replication schedule. This lets you schedule start and stop times for each day in the week in which you want the Replication process to run.

## schedule --delete

### Description

Deletes a day in an existing Cleaner or Replication schedule for a QoreStor instance. The **--name** option is only applicable for replication and not for the cleaner. You can use it to specify a container.

**NOTE:** To delete days from either an existing Cleaner or Replication schedule, specify the day in the week and the schedule type.

### Syntax

```
schedule --delete --day <Day of the week (Sunday|Monday...)>
       [--cleaner]
```

```
       [--name <name>]
       [--replication]
       [--cloudreplication]
       [--cloud_archive]
```

Where

```
--day                Day of the schedule to delete.
--cleaner            Delete a cleaner schedule.
--name               Replication source Container Name.
--replication        Delete a specific replication source container's schedule.
--cloudreplication   Delete a specific cloud replication source container's
schedule.
--cloud_archive      With cloud_replication, set a cloud tier by default. Also for
an archive tier.
```

### Result

```
Successfully updated Cleaner schedule.
```

## schedule --help

### Description

Displays the list of schedule-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
schedule --help
```

### Result

```
Usage:

schedule --show [--cleaner]
       [--replication]
       [--cloudreplication]
       [--cloud_archive]
       [--name <name>]

schedule --add --day <Day of the week (Sunday|Monday...)>
       [--cleaner]
       [--replication]
       [--cloudreplication]
       [--start_time <HH:MM>]
       [--stop_time <HH:MM>]
       [--name <name>]
       [--cloud_archive]

schedule --delete --day <Day of the week (Sunday|Monday...)>
       [--cleaner]
       [--name <name>]
       [--replication]
```

```
       [--cloudreplication]
       [--cloud_archive]

schedule --help

schedule <command> <command-arguments>
<command> can be one of:

       --show     Displays command specific information.
       --add      Adds a schedule for cleaner (use on source DR).
       --delete   Deletes a cleaner schedule (use on source DR).

For command-specific help, please type schedule --help <command>
eg:
schedule --help show
```

# VTL

The VTL commands allow you to manage the virtual tape library (VTL) containers you have created for your system, including the ability to create additional tapes for your libraries, set drives to read/write, or activate and deactivate replica VTLs.

# VTL Command Usage

This topic introduces the QoreStor CLI commands that allow you to manage the virtual tape library (VTL) containers you have created for your system, which include:

- **vtl --show [options]**
- **vtl --update_carts [options]**
- **vtl --import_cart [options]**
- **vtl --activate --name [options]**
- **vtl --deactivate --name**
- **vtl --rescan --name [options]**
- **vtl --set_rw [options]**
- **vtl --show_replstate --name**
- **vtl --help**

# vtl --show

## Description

This command allows you to see the status of a specified virtual tape library (VTL). It displays detailed information about VTL, such as media type, vendor, model, generic device information, serial number, library size, and tape status information. The first example below shows the result information for Container vtl1 of type VTL with an NDMP connection. The second example shows Container iscsi-vtl1 of type VTL with an iSCSI connection.

## Syntax

```
vtl --show [--verbose] [--name <name>]
```

Where

```
--verbose   Display more details.

--name      Name of a valid VTL container
```

## Result

```

```

# vtl --update_carts

### Description

This command allows you to create additional tapes for a library specified in the --name option. Each library is initially created with 10 slots housing 60 tape media. Additional tapes can be added to the library as needed using this command. A library can only contain tapes of the same size. For example, if the library was originally created with 60 tapes of size 10G, additional tapes of size 10G can only be added.

### Syntax

```
vtl --update_carts --name <name> --add --no_of_tapes <number>
```

Where

```
--name          Name of a valid VTL container

--add           Add more cartridges to the tape

--no_of_tapes   Number of Tapes to be created
```

### Result

```
Created 10 cartridges.
```

# vtl --activate

### Description

This command activates a replica VTL.

### Syntax

```
vtl --activate --name <name> [--force <yes|no>]
```

Where

```
--name    Name of a valid VTL container

--force   Force activation
```

### Result

```
Enter reserialization code for replica [ 00 (no op), 01 - 99 ]: 00
VTL processes will be started for container, VTL1_Test ...
```

# vtl --deactivate

### Description

This command deactivates a replica VTL.

### Syntax

```
vtl --deactivate --name <name>
```

Where

```
--name   Name of a valid VTL container
```

### Result

```
Are you sure you want to de-activate this VTL? [ Yes, No ] y
VTL VTL1_Test is deactivated !!
```

# vtl --rescan

### Description

This command rescans a replica VTL.

### Syntax

```
vtl --rescan --name <name> [--force <yes|no>]
```

Where

```
--name    Name of a valid VTL container
--force   Force activation
```

### Result

```
Rescan replica VTL after new cartridges have been added at source VTL? [Yes|No] y

Connections to the library VTL1_Test could be disrupted for a brief period.
Make sure no cartridges are loaded in tape drives and/or backups are in progress.
Proceed? [Yes|No] y
vtllibrary will be re-instantiated for container, VTL1_Test!
```

# vtl --restore

### Description

Initiate restore of cart(s) data from an archive storage tier to a c loud storage tier

### Syntax

```
vtl --restore --name <name> --barcode <barcode>
```

Where

```
--name          Name of a valid VTL container

--barcode       Comma seperated list of cartridge(s) barcode that need to be
restored from the archive storage tier
```

### Result

container:"<name>" cart:"<barcode>" current status: ""

/opt/qorestor/bin/ctrlrpc -p 9911 -t 60 --container_id 8 --scid 1152921504606847078 --scid 1152921504606847080 --scid 1152921504606847079 --async --xattr_scid 1152921504606847259 --all_or_none: result: 0

Successfully Initiated restore job for <name> with barcode: <barcode>.

Restore initiation was successful for the following cart(s):"<barcode>"

# vtl --set_rw

### Description

This command allows you to set the drives in a VTL container to read/write. The arguments to this command are as follows:

- **--name** — Specifies the name of a valid VTL container.
- **--id** — Sets the IO mode of a specific drive to RW.

### Syntax

```
vtl --set_rw --name <name> [--id <number>]
```

Where

```
--name   Name of a valid VTL container
--id     Set the io mode of a particular drive to rw
```

### Result

```
I/O mode set to readwrite for the drive with id 81 in container ndmp
```

# vtl --show_replstate

### Description

This command shows the replication state of a specified VTL replication source container.

### Syntax

```
vtl --show_replstate --name <name>
```

Where

```
--name   Name of a valid VTL replication source container
```

### Result

```
Cartridges with data, INSYNC with peer:
---------------------------------------
 AFNGC6003 AFNGC6004 AFNGC6005 AFNGC6006 AFNGC6007 AFNGC6008 AFNGC6009 AFNGC600A

 AFNGC6011 AFNGC6012 AFNGC6013 AFNGC6014 AFNGC6002 AFNGC6001
Total 38 cartridges synchronized with peer VTL.

Cartrdges with data, not INSYNC with peer:
-----------------------------------------
 None.
Total 0 cartridges NOT synchronized with peer VTL.

Cartridges that do not have data are not displayed.
```

# vtl --help

### Description

Displays the list of vtl-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
vtl --help
```

### Result

```
Usage:
       vtl --show [--verbose]
               [--name <name>]

       vtl --update_carts --name <name>
               --add
               --no_of_tapes <number>

       vtl --import_cart --name <name>
               --barcode <barcode>

       vtl --activate --name <name>
               [--force <yes|no>]

       vtl --deactivate --name <name>

       vtl --rescan --name <name>
               [--force <yes|no>]

       vtl --set_rw --name <name>
               [--id <number>]

       vtl --show_replstate --name <name>

       vtl --help

       vtl <command> <command-arguments>
```

```
<command> can be one of:
        --show              Displays command specific information.
        --update_carts      Add cartridges
        --import_cart       import cartridges from cloud
        --activate          Activate a replica VTL
        --deactivate        De-activate a replica VTL
        --rescan            Rescan a replica VTL
        --set_rw            Set drives in a vtl container to read write
        --show_replstate    Show replication state of a container
For command-specific help, please type vtl --help <command>
        eg:
        vtl --help show
```

# 5

# Maintaining QoreStor

This topic introduces the CLI commands that are useful for managing the filesystem and performing system maintenance-related tasks.

- The Maintenance command and its options are used to perform filesystem and system maintenance.

# Maintenance

The QoreStor CLI **maintenance** commands lets you display the system maintenance repair progress, and manage the data repair and state of a QoreStor system.

**NOTE:** Whenever the QoreStor enters or exits from the **Maintenance** mode state, communication via OST, RDA, CIFS, and NFS is lost.

The **maintenance --filesystem** commands perform maintenance operations on the QoreStor file system, the **maintenance --diags** command allow you to create and view diagnostic bundles for your QoreStor system.

**NOTE:** This set of maintenance commands provide some functionality that is not available in the QoreStor GUI. To check the status of the QoreStor server, use the QoreStor CLI **system --show** command to display the current status.

# Maintenance command

This topic introduces the **maintenance** command usage:

**NOTE:** Using some of the maintenance command options could result in the deletion of data. Carefully observe the warnings (for example, running the scan without running the repair). If you have questions, do not perform these QoreStor CLI command options without first contacting Technical Support.

- **maintenance --filesystem**
  - **--scan_report [verbose]**
  - **--repair_status [verbose]**
  - **--repair_history [verbose]**
  - **--scan_restart [verify_data | verify_rda_metadata | verify_metadata]**
  - **--repair_now**
  - **--reclaim_space**
  - **--stop_reclaim_space**
  - **--clear_quarantine**
  - **--start_scan [verify_data | verify_rda_metadata | verify_metadata] [--storage_group <name>]**
  - **--stop_scan**
- **maintenance --diags**
  - **--collect [basic]**
  - **--show**
  - **--delete <name>**
  - **--delete_all**
- **maintenance --disaster_recovery [options]**
- **maintenance --help**

> **NOTE:** If you specify a command without supplying the expected value or option, you are prompted to provide the correct value or option.

# maintenance --filesystem [--scan_status]

### Description

Displays the current filesystem checker status and scan progress for a QoreStor.

### Syntax

```
maintenance --filesystem --scan_status
```

### Result

```
Filesystem checker              : Scan in progress
Filesystem check status:
DataBlock Consistency Checker Stats
===================================
Phase                           : INODE CRAWL
Inode check                     : IN PROGRESS
Inodes processed                : 3200 / 3498
Time left (approx)              : 4 secs

```

# maintenance --filesystem --scan_report

### Description

Displays the current filesystem checker report, which is generated by the QoreStor CLI maintenance --filesystem [--start_scan [verify_data | verify_rda_metadata | verify_metadata] [--storage_group <name>] command.

### Syntax

```
maintenance filesystem --scan_report [verbose]
```

### Result

```
Filesystem check report
=======================
Report generated at             : Fri Dec  9 08:23:05 2016

There are no problems detected.
```

# maintenance --filesystem [--repair_history [verbose]]

### Description

Displays the filesystem checker history for a QoreStor.

### Syntax

```
maintenance --filesystem --repair_history
```

### Result

```
Filesystem check time           : Wed Nov 23 21:59:10 2016
Dry run finished at             : Wed Nov 23 21:59:14 2016
```

```
Release version                 : 4.0.0254.0
Build                           : 62141
Data verification               : Not Enabled
Scan mode                       : Normal scan
Result                          : No inconsistencies discovered.
Storage Group(s)                : sg2

Filesystem check time           : Tue Nov 29 22:13:54 2016

Result                          : No inconsistencies discovered.
Storage Group(s)                : sg2
```

# maintenance --filesystem [--scan_restart ]

### Description

Restarts file system checker to generate updated report.

> **NOTE:** Argument **verify_data** validates data with pre-built checksum. Argument **verify_rda_metadata** scans only OST and RDA containers. Argument **verify_metadata** scans only the namespace for all containers.

### Syntax

```
maintenance --filesystem --scan_restart [verify_data| verify_rda_metadata |
verify_metadata]
```

### Result

```
Successfully restarted filesystem scan.
```

# maintenance --filesystem [--repair_now]

### Description

Repairs any filesystem issues in a QoreStor based on the repair report findings.

### Syntax

```
maintenance --filesystem  [--repair_now]
```

### Result

```
Make sure ocafsd service is stopped...DONE
Start ocafsd service in maintenance mode...DONE
Cleaner backlog is empty
Stopping the ocafsd.........DONE
Repairing storage group "DefaultGroup"
ofsck.exe --rpcport 9917 --repair_from_report  --disk_journal_path Q:\Repository
\ocaroot\\journals --nvm_journal_path Q:\Repository\ocaroot\\journals --group_id
0
Quarantine enabled
Unlinked ofsck marker files.
ofsck.exe --rpcport 9917 --repair_from_report  --disk_journal_path Q:\Repository
\ocaroot\\journals --nvm_journal_path Q:\Repository\ocaroot\\journals --group_id
0 - rc = 0
Ofsck run complete
Start ocafsd service in operational mode.....................................
.....................................................................................
.....................................................................................
.....................................................................................
.....................................DONE
```

# maintenance --filesystem --reclaim_space

### Description

Reclaims disk space that was formerly occupied by data in the laundry in a QoreStor using the Cleaner process. This command is what is commonly referred to as “manually” running the Cleaner process to reclaim disk space.

### Syntax

```
maintenance --filesystem --reclaim_space
```

### Result

```
Successfully started cleaner.
```

# maintenance --filesystem [--stop_reclaim_space]

### Description

Stops Cleaner running in run-once mode (as the result of executing the **--reclaim space** command)

### Syntax

```
maintenance --filesystem --stop_reclaim_space
```

### Result

```
Successfully stopped cleaner.
```

# maintenance --filesystem [--clear_quarantine]

### Description

Clears a specialized quarantine folder that collects data files considered corrupted after attempts have been made to perform repairs by the filesystem. The maintenance --filesystem CLI commands should only be performed when the QoreStor is in its **Maintenance** mode. This command should not need to be run on a regular basis (it should only be run when a lengthy period of time has elapsed or you feel that the space in the quarantine folder needs to be reclaimed).

### Syntax

```
maintenance --filesystem --clear_quarantine
```

### Result

```
Successfully performed quarantine cleanup.
```

# maintenance --filesystem [--start_scan [verify_data | verify_rda_metadata | verify_metadata] [--storage_group <name>]

### Description

Starts filesystem checker to check for consistency issues in storage groups.

**NOTE:** Argument verify_data validates data with pre-built checksum. Argument verify_rda_metadata scans only OST and RDA containers. Argument verify_metadata scans the namespace for all containers.

**NOTE:** Using this command places the files system into a read-only mode and pauses all active replications. When the QoreStor enters **Maintenance** mode, an alert is sent that indicates this operational change.

### Syntax

```
maintenance --filesystem --start_scan verify_data --storage_group SGTest1
```

### Result

```
This operation will make the filesystem read-only and pause all active replications.
"verify_data" option will check for data consistency issues in the filesystem.  This
might take long time to complete.
Do you want to continue (yes/no) [n]? y
Please enter the administrator password:

Filesystem check started successfully.

To see the status, please run "maintenance --filesystem --scan_status".
```

If you enter the maintenance --filesystem --scan_restart command when the QoreStor is not in **Maintenance** mode, the following output is displayed at the system prompt:

```
maintenance --filesystem --scan_restart
```

```
"Operation not supported as system is not in maintenance mode.
To be able to restart scan, filesystem check must be running or waiting".
```

# maintenance --filesystem [--stop_scan]

### Description

Stops the filesystem scan process that verifies the data contained in a QoreStor.

### Syntax

```
maintenance --filesystem --stop_scan
```

### Result

```
This operation will stop the filesystem checker and put the system back into
operational mode.
Do you want to continue (yes/no) [n]? y
Please enter the administrator password:
Filesystem check stopped successfully.
```

# maintenance --diags --collect

### Description

Generates a new diagnostics log file that represents the current state of a QoreStor. This command option is only available in the CLI.

### Syntax

```
maintenance --diags
           [--collect [basic]]
           [--show]
           [--delete <name>]
           [--delete_all]
```

### Result

```
 maintenance  --diags  --collect  basic

 Collecting  diagnostics...

 Collecting  logs...
 Diagnostics  log  location:  /var/diagnostic_logs/anil-c81-tst1_2021-08-30_23-18-
37.lzip
 Done
```

# maintenance --diags --show

### Description

Displays a list of the diagnostics log files. The diagnostics log files are a collection of all QoreStor-related information that describe the current state of your system.

### Syntax

```
maintenance --diags --show
```

## Result

```
maintenance  --diags  --show
Diagnostics  log  location:  /var/diagnostic_logs
qorestor_2018-06-06_08-24-07.lzip           42219418
qorestor_2018-06-06_12-09-26.lzip           42005069
Done
```

# maintenance --diags --delete <name>

### Description

Deletes the named diagnostics file.

### Syntax

```
maintenance --diags --delete qsvm1_2018-06-06_10-31-19.lzip_
```

## Result

```
Deleting diagnostics qsvm1_2018-06-06_10-31-19.lzip_
```

# maintenance --diags --delete_all

### Description

Deletes all of the diagnostics files on a QoreStor server.

> **CAUTION: Carefully consider before using the --delete_all command. If you delete all diagnostics log files without first saving them to another location, all previous system status information that they contained is lost and unrecoverable.**

### Syntax

```
maintenance --diags --delete_all
```

### Result

```
Deleting all diagnostics
```

# maintenance --disaster_recovery

### Description

Begins a disaster recovery of the QoreStor server using data archived to a cloud tier.

### Syntax

```
maintenance --disaster_recovery [--cloud_string <name>]
               [--container_name <name>]
               [--cloud_provider_type <name>]
               [--passphrase <name>]
               [--logfile <name>]
               [--quick_ro_recovery <[yes | no]>]
```

Where

```
--cloud_string          Cloud connection string, to connect to the cloud bucket.
--container_name        Name of the cloud bucket from where data is to be recovered.
Valid values are [a-z, 0-9, '-', '.'].
--cloud_provider_type   Name of the cloud service provider, such as <AWS-S3 | Azure
| Wasabi-S3 | Google-S3 | IBM-S3 | S3-Compatible>.
--passphrase            Passphrase used on original machine for encrypting the data
in the cloud bucket.
--logfile               Log file path to capture the ongoing recovery activity.
--quick_ro_recovery     Fast disaster recovery, with data in cloud bucket accessible in
RO mode only.
```

### Result

```
Filesystem disaster recovery started successfully.
```

# maintenance --help

### Description

Displays the list of maintenance-related options that can be used as a reference when using the QoreStor CLI.

### Syntax

```
maintenance --help
```

### Result

```
Usage:

maintenance --filesystem [--scan_status]
       [--scan_report [verbose]]
       [--repair_status [verbose]]
       [--repair_history [verbose]]
       [--scan_restart [verify_data | verify_rda_metadata | verify_metadata]]
       [--repair_now]
       [--reclaim_space]
```

```
       [--stop_reclaim_space]
       [--clear_quarantine]
       [--start_scan [verify_data | verify_rda_metadata | verify_metadata]]
       [--storage_group <name>]
       [--stop_scan]
       [--shutdown]

maintenance --diags [--collect]
       [--show]
       [--delete <name>]
       [--delete_all]

maintenance --disaster_recovery --cloud_string <name>
       --container_name <name>
       --cloud_provider_type <name>
       --passphrase <name>
       [--logfile <name>]

maintenance --help

maintenance <command> <command-arguments>
<command> can be one of:
       --filesystem                    Maintenance operations on filesystem.
       --diags                         Diags operations.
       --disaster_recovery             Disaster recovery

For command-specific help, please type maintenance --help <command>
eg:
maintenance --help filesystem
```

Quest provides software solutions for the rapidly-changing world of enterprise IT. We help simplify the challenges caused by data explosion, cloud expansion, hybrid datacenters, security threats, and regulatory requirements. We are a global provider to 130,000 companies across 100 countries, including 95% of the Fortune 500 and 90% of the Global 1000. Since 1987, we have built a portfolio of solutions that now includes database management, data protection, identity and access management, Microsoft platform management, and unified endpoint management. With Quest, organizations spend less time on IT administration and more time on business innovation. For more information, visit www.quest.com.

# Technical support resources

Technical support is available to Quest customers with a valid maintenance contract and customers who have trial versions. You can access the Quest Support Portal at https://support.quest.com.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to-videos
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
