## Preface

Welcome to syslog-ng Store Box (SSB) version 6.10.0 and thank you for choosing our product. This document describes the process to upgrade existing SSB installations to SSB 6.10.0. The main aim of this paper is to aid system administrators in planning the migration to the new version of SSB.

For detailed information about versioning and supported upgrade paths in SSB, see [Administration Guide](#).

**CAUTION:**

**Read the entire document thoroughly before starting the upgrade.**

## Prerequisites and Notes

This section and its subsections contain information about the following:

### Version numbering in SSB

All releases of syslog-ng Store Box (SSB) belong in the following categories (including their respective maintenance releases):

- **LTS release version**

Format: <major.0.maintenance>, for example, 6.0.0, 6.0.1

For more information, see the **Long Term Support (LTS)** section under [the syslog-ng Store Box Product Life Cycle Table](#).

- **Feature release version**

Format: <major.minor.maintenance>, for example, 4.9.1, or 6.5.0

For more information, see the **Feature release** section under [the syslog-ng Store Box Product Life Cycle Table](#).

### Upgrade paths to SSB

These sections contain information about the general guidelines for supported direct upgrade paths in syslog-ng Store Box (SSB), the possible upgrade scenarios, and their recommended upgrade paths for upgrading from LTS or Feature releases to LTS or Feature releases, and detailed information about the possible upgrade paths to the current version of SSB (currently, version 6.10.0).

For detailed information, see the following subsections:

# Guidelines and support for direct upgrade paths in SSB

This section provides general guidelines for supported direct upgrade paths in syslog-ng Store Box (SSB).

For more information about possible upgrade scenarios, and their recommended upgrade paths for upgrading from LTS or Feature releases to LTS or Feature releases, see [Possible upgrade path scenarios, and their recommended upgrade paths](#).

For more information about specific upgrade paths to the current release of SSB (version 6.10.0), see [Upgrade paths to the current version of SSB](#).

## General guidelines for direct upgrade paths

The following general guidelines apply for direct upgrade paths in SSB at all times:

- **Maintenance version prerequisites**

Before you upgrade from any LTS or Feature release version, always make sure that the release you are using has the latest available maintenance version installed. Otherwise, always upgrade directly to the latest available maintenance version of the release version you are using.

### Examples: meeting maintenance version prerequisites before upgrading

The following examples illustrate two different upgrade scenarios when you can not upgrade directly and have to meet the maintenance requirements first.

#### Feature release version

If your SSB appliance is at feature version 4.9.0, we need to do a direct upgrade to 4.9.1 (that is, to the latest available 4 F9 maintenance version) before upgrading forward.

#### LTS version

If your SSB appliance is at 5.0.1, we need to do a direct upgrade to version 5.0.4 (that is, to the latest available 5 LTS maintenance version) before upgrading forward.

- **Supported direct upgrade scenarios**

Direct upgrade scenarios are only available to the next LTS releases (or the preceding versions).

### Example: direct upgrade

For example, from version 5.0.4, you can jump directly to versions 5.1.0, 5.2.0, ..., 6.0.1.

However, it is not possible to do a single-step, direct upgrade to a version that is larger than the next LTS release (for example, from version 5.1.0 to version 6.5.0).

**NOTE:** While it is not possible to do a single-step upgrade (for example, directly upgrading from version 5.1.0 to version 6.5.0), you can upgrade from version 5.1.0 to version 6.5.0 in two steps, by first upgrading to the latest available maintenance version of 6 LTS, and then further upgrading to version 6.5.0.

## Possible upgrade path scenarios, and their recommended upgrade paths

The following examples illustrate possible upgrade scenarios, and their recommended upgrade paths for upgrading from LTS or Feature releases to LTS or Feature releases:

Example for	From	To	Recommended (optimal) upgrade path
LTS to next LTS upgrade	5.0.0	6.0.1	5.0.0 to 5.0.4, then to 6.0.1
Complex upgrade, with several upgrade steps	4.9.0	6.5.0	4.9.0 to 4.9.1, then to 5.0.4, then to 6.0.1, then to 6.5.0
Direct, single-step upgrade	6.1.0	6.5.0	6.1.0 to 6.5.0

From older releases, upgrade to 6 LTS first. For details, see [How to upgrade to syslog-ng Store Box 5 LTS](#).

For more information about specific upgrade paths to the current release of SSB (version 6.10.0), see [Upgrade paths to the current version of SSB](#).

For more information about guidelines for supported direct upgrade paths in SSB, see [Guidelines and support for direct upgrade paths in SSB](#).

## Upgrade paths to the current version of SSB

This section contains detailed information about the possible upgrade paths to the current version of syslog-ng Store Box (SSB). The most recent SSB version is 6.10.0.

For more information about the versioning system in SSB, see [Version numbering in SSB](#).

For more information about guidelines for supported direct upgrade paths in SSB, see [Guidelines and support for direct upgrade paths in SSB](#).

## Upgrade paths to the current version of SSB (version 6.10.0)

Upgrading to SSB version 6.5 is tested and supported using the following upgrade path scenarios:

- The latest SSB 6 LTS maintenance version (for example, 6.0.x) to version SSB 6.5  
**NOTE:** Always upgrade to the latest available maintenance version of SSB 6 LTS before upgrading to SSB version 6.5.
- The latest maintenance versions of the previous, not yet discontinued, feature releases to version SSB 6.5

# Upgrade checklist

The following list applies to all configurations:

- The firmware of your SSB appliance is not tainted (that is, none of its files were modified locally). If the firmware is tainted, a warning is displayed on the **Basic Settings > System > Version details** page.  
Upgrading is not supported if the firmware is tainted. If your firmware is tainted, [contact our Support Team](#).
- You have backed up your configuration and your data.  
For more information on creating configuration and data backups, see "[Data and configuration backups](#)" in the [Administration Guide](#).
- For added safety, you have also exported the current configuration of SSB.  
For detailed instructions, refer to "[Exporting the configuration of SSB](#)" in the [Administration Guide](#).
- You have a valid [support portal](#) account.  
To download the required firmware file, you need a valid [support portal](#) account. To create an account, navigate to the [support portal](#) and follow the instructions on screen (you will need to enter your product's asset number, which is the license number or serial number you have been provided previously).
- You have downloaded the latest SSB firmware file from the [Downloads page](#).  
For a details about the firmware file, see "[Firmware in SSB](#)" in the [Administration Guide](#).
- You have read the Release Notes (changelog) of the firmware(s) before updating. The Release Notes might include additional instructions specific to the firmware version.  
The Release Notes are available on the [syslog-ng Store Box Documentation page](#).

If you have a high availability cluster:

- ▲ **CAUTION:** Before upgrading to SSB version 6.10.0 in High Availability (HA) mode, ensure that the nodes have already been restarted since the last upgrade. Otherwise, you have to restart the nodes before upgrading SSB to version 6.10.0.
- You have IPMI access to the slave node. You can find detailed information on using the IPMI interface in the following documents:
 

For syslog-ng Store Box (SSB) Appliance 3000 and 3500, see the [Latest IPMI firmware for Syslog-ng Store Box 3000/3500 and One Identity Safeguard for Privileged Sessions 3000/3500 appliances](#).

For syslog-ng Store Box (SSB) T1 and syslog-ng Store Box (SSB) T4, see the [IPMI User's Guide](#).
- You have verified on the **Basic Settings > High Availability** page that the HA status is not degraded.
- If you have a high availability cluster with geocustering enabled: Perform the firmware upload steps an hour before the actual upgrade. Geocustering can introduce delays in the synchronization between the primary and the secondary node, and the secondary node might not be able to sync the new firmware from the primary node on time.

If you are upgrading SSB in a virtual environment:

**NOTE:** When setting up a virtual environment, carefully consider the configuration aspects such as CPU, memory availability, I/O subsystem, and network infrastructure to ensure the virtual layer has the necessary resources available. Please consult [One Identity's Product Support Policies](#) for more information on environment virtualization.

- You have created a snapshot of the virtual machine before starting the upgrade process.
- You have configured and enabled console redirection (if the virtual environment allows it).

During the upgrade, SSB displays information about the progress of the upgrade and any possible problems to the console, which you can monitor with IPMI (ILOM) or console access.

We recommend that you test the upgrade process in a non-production (virtual) environment first.

Upgrading SSB requires a reboot. We strongly suggest that you perform the upgrade on the production appliance during maintenance hours only, to avoid any potential data loss.

## Upgrading to SSB 6.10.0

For details on upgrading your syslog-ng Store Box (SSB) installation to 6.10.0, see the following procedures.

### Upgrading SSB

If you want to upgrade a SSB cluster, see [Upgrading an SSB cluster](#) on page 11.

#### Prerequisites

Read the following warnings before starting the upgrade process.

#### ***To upgrade a standalone SSB node to version 6.10.0***

1. Stop SSB from accepting the incoming log traffic. Navigate to **Basic Settings > System > Service control** and click **Disable**.
2. Update the firmware of SSB using the web interface.
  - a. Navigate to **Basic Settings > System > Upgrade**.
  - b. Upload the new .ISO file.
  - c. When the upload is finished, click **Upgrade and reboot node**.
3. Navigate to **Basic Settings > System > System Control > This node**, and choose **Reboot**.

SSB attempts to boot with the new firmware. Wait for the process to complete.
4. *Recommended step.* To help troubleshoot potential issues following the upgrade, collect and save system information (create a debug bundle) now.

Navigate to **Basic Settings > Troubleshooting > System debug** and choose **Collect and save current system state info**.
5. Navigate to **Basic Settings > System > Version details** and check the version numbers of SSB. In case you encounter problems, you can find common troubleshooting steps in [Troubleshooting](#) on page 12.

6. Enable SSB to receive the incoming log traffic. Navigate to **Basic Settings > System > Service control** and click **Enable**.

## Upgrading an SSB cluster

### Prerequisites

Make sure that you have physically connected the IPMI interface to the network and that it is properly configured. This is important because you can only power the secondary node on through the IPMI interface. For details on configuring the IPMI interface, see "[Out-of-band management of SSB](#)" in the [Administration Guide](#).

### To upgrade an SSB cluster

1. Stop SSB from accepting the incoming log traffic. Navigate to **Basic Settings > System > Service control** and click **Disable**.
2. Update the firmware of SSB using the web interface.
  - a. Navigate to **Basic Settings > System > Upgrade**.
  - b. Upload the new .ISO file.
  - c. When the upload is finished, click **Upgrade, reboot master, and shut down slave**.

3. Log in to the SSB web interface to verify that the primary node upgrade was successful.

Navigate to **Basic Settings > System > Version details** and check the version numbers of SSB. In case you encounter problems, you can find common troubleshooting steps in [Troubleshooting](#) on page 12.

4. Use the IPMI interface to start the secondary node.

The secondary node attempts to boot with the new firmware, and reconnects to the primary node to sync data. During the sync process, certain services (including Heartbeat) are not available. Wait for the process to finish, and the secondary node to boot fully.

5. Navigate to **Basic Settings > System > High availability & Nodes** and verify that the secondary node is connected, and has the same firmware versions as the primary node.

#### NOTE:

When upgrading an SSB cluster, the upgrade process on the slave node will only be completed once a takeover has been performed.

6. Enable SSB to receive the incoming log traffic. Navigate to **Basic Settings > System > Service control** and click **Enable**.

## Troubleshooting

If you experience any strange behavior of the web interface, first try to reload the page by holding the SHIFT key while clicking the Reload button of your browser to remove any cached version of the page.

In the unlikely case that SSB encounters a problem during the upgrade process and cannot revert to its original state, SSB performs the following actions:

- Initializes the network interfaces using the already configured IP addresses.
- Enables SSH access to SSB, unless SSB is running in sealed mode. That way it is possible to access the logs of the upgrade process, which helps the Support Team to diagnose and solve the problem. Note that SSH access will be enabled on every active interface, even if management access has not been enabled for the interface.

In case the web interface is not available within 30 minutes of rebooting SSB, check the information displayed on the local console and [contact our Support Team](#).
