Security checklist for configuring One Identity Safeguard for Privileged Sessions (SPS)

The following checklist is a set of recommendations and configuration best practices to ensure that your One Identity Safeguard for Privileged Sessions (SPS) is configured securely.

Encryption-related settings

- | **TIP:** One Identity recommends using 2048-bit RSA keys (or stronger).
- Use strong passwords: at least 8 characters that include numbers, letters, special characters, and capital letters. For local One Identity Safeguard for Privileged Sessions (SPS) users, require the use of strong passwords (set **Users & Access Control > Login options > Minimal password strength** to strong). For more information, see "[Setting password policies for local users](#)" in the [Administration Guide](#).
- When exporting the configuration of SPS, or creating configuration backups, always use encryption. Handle the exported data with care, as it contains sensitive information, including credentials. For details on encrypting the configuration, see "[Encrypting configuration backups with GPG](#)" in the [Administration Guide](#).
- Use every keypair or certificate only for one purpose. Do not reuse cryptographic keys or certificates (for example, do not use the certificate of the One Identity Safeguard for Privileged Sessions (SPS) webserver to encrypt audit trails, or the same keypair for signing and encrypting data).
- Do not use the CBC block cipher mode, or the diffie-hellman-group1-sha1 key exchange algorithm. For details, see "[Supported encryption algorithms](#)" in the [Administration Guide](#).
- Always encrypt your audit trails to protect sensitive data. For details, see "[Encrypting audit trails](#)" in the [Administration Guide](#).

Connection policies

- When configuring connection policies, always limit the source of the connection to the client network that requires access to the connection.
- Always use gateway authentication to authenticate clients. Do not trust the source IP address of a connection, or the result of server authentication.
- To prevent Denial of Service (DoS) attacks against One Identity Safeguard for Privileged Sessions (SPS), set the **Connection rate limit** option of your connection policies. For details, see ["Configuring connections" in the Administration Guide](#).
- Configure your RDP connection policies to use strong encryption. To enable SSL-encryption for the RDP protocol, see ["Enabling TLS-encryption for RDP connections" in the Administration Guide](#).
- In RDP connections, if the client uses the Windows login screen to authenticate on the server, the password of the client is visible in the audit trail. To avoid displaying the password when replaying the audit trail, encrypt the upstream traffic in the audit trail using a separate certificate from the downstream traffic.

For more information, see ["Encrypting audit trails" in the Administration Guide](#).

- Ensure that host key verification is enabled in SSH connection policies. That is, the **Server side host key settings > Allow plain host keys** and **Server side host key settings > Allow X.509 host certificates** options do not have the **No check required** option selected. For details, see ["Setting the SSH host keys of the connection" in the Administration Guide](#).

Appliance access

- Accessing the One Identity Safeguard for Privileged Sessions (SPS) host directly using SSH is not recommended or supported, except for troubleshooting purposes. In such case, the One Identity Support Team will give you exact instructions on what to do to solve the problem.

For security reasons, disable SSH access to SPS when it is not needed. For details, see ["Enabling SSH access to the One Identity Safeguard for Privileged Sessions \(SPS\) host" in the Administration Guide](#).

- Permit administrative access to SPS only from trusted networks. If possible, monitored connections and administrative access to the SPS web interface should originate from separate networks.
- Configure SPS to send an alert if a user fails to login to SPS. For details, see the **Login failed** alert in ["System related traps" in the Administration Guide](#).
- Configure **Disk space fill-up prevention**, and configure SPS to send an alert if the free space on the disks of SPS is low. For details, see ["Preventing disk space fill-up" in the Administration Guide](#).

Networking considerations

- One Identity Safeguard for Privileged Sessions (SPS) stores sensitive data. Use a firewall and other appropriate controls to ensure that unauthorized connections cannot access it.
- If possible, enable management access to SPS only from trusted networks.
- Make sure that the HA interface of SPS is connected to a trusted network.

About us

One Identity solutions eliminate the complexities and time-consuming processes often required to govern identities, manage privileged accounts and control access. Our solutions enhance business agility while addressing your IAM challenges with on-premises, cloud and hybrid environments.

Contacting us

For sales and other inquiries, such as licensing, support, and renewals, visit <https://www.oneidentity.com/company/contact-us.aspx>.

Technical support resources

Technical support is available to One Identity customers with a valid maintenance contract and customers who have trial versions. You can access the Support Portal at <https://support.oneidentity.com/>.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to videos at www.YouTube.com/OneIdentity
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
