Preface

Welcome to the syslog-ng Store Box 7.4.0 Installation Guide.

This document describes how to set up the syslog-ng Store Box (SSB) hardware and install SSB on certified hardware or as a VMware virtual appliance.

NOTE: When setting up a virtual environment, carefully consider the configuration aspects such as CPU, memory availability, I/O subsystem, and network infrastructure to ensure the virtual layer has the necessary resources available. Please consult [One Identity's Product Support Policies](#) for more information on environment virtualization.

Summary of contents

[Introduction](#) on page 6 provides background information and describes the main purpose of the syslog-ng Store Box Installation Guide.

[Package contents inventory](#) on page 7 lists the contents of the package you receive with the syslog-ng Store Box (SSB).

[syslog-ng Store Box Hardware Installation Guide](#) on page 8 describes how to set up the SSB hardware.

[Hardware specifications](#) on page 13 describes the hardware specifications of the SSB appliance.

[syslog-ng Store Box Software Installation Guide](#) on page 18 describes how to install SSB on certified hardware.

[syslog-ng Store Box VMware Installation Guide](#) on page 21 describes how to install SSB as a VMware virtual appliance.

Target audience and prerequisites

This guide is intended for system administrators, network administrators, and system integrators responsible for server administration processes within an organization.

The following skills and knowledge are necessary for a successful SSB administrator:

- At least basic system administration knowledge.
- An understanding of networks, TCP/IP protocols, and general network terminology.
- An understanding of system logging and the protocols used in remote system logging.
- Familiarity with the concepts of the syslog-ng and the syslog-ng Agent for Windows applications.
- Working knowledge of the UNIX or Linux operating system is not mandatory but highly useful.

Products covered in this guide

This guide describes how to set up and install the syslog-ng Store Box version 7.4.0.

NOTE: Users of the syslog-ng Store Box are entitled to use the syslog-ng Premium Edition application as a log collector agent for SSB. This guide does not cover the installation and configuration of syslog-ng Premium Edition, for details, see the [syslog-ng Store Box Documentation page](#).

Introduction

The aim of this guide is to provide detailed, step-by-step instructions on how to set up and install syslog-ng Store Box on unpacking it and any subsequent occasions that might require the re-installation of the product.

Note that the contents of this document were previously included in the syslog-ng Store Box Administrator Guide. This standalone guide was created to:

- Improve how information is organized in the syslog-ng Store Box documentation set.
- Make it easier for users to find information relevant to their roles, context, and how they use the product.

Package contents inventory

Carefully unpack all server components from the packing cartons. The following items should be packaged with the syslog-ng Store Box:

- A syslog-ng Store Box appliance, pre-installed with the latest syslog-ng Store Box firmware.
- syslog-ng Store Box accessory kit, including the following:
 - syslog-ng Store Box 7.4.0 Packaging Checklist (this document).
 - GPL v2.0 license.
- Rack mount hardware.
- Power cable.

The default BIOS and IPMI passwords are in the documentation.

syslog-ng Store Box Hardware Installation Guide

This section describes how to set up the syslog-ng Store Box (SSB) hardware. Refer to the following documents for step-by-step instructions:

- *syslog-ng Store Box Appliance 3000*: see the *SC113 Chassis Series User's Manual, Chapter 6: Rack Installation*, available online at <https://www.supermicro.com/manuals/chassis/1U/SC113.pdf>.
- *syslog-ng Store Box Appliance 3500*: see the *SuperServer 1029U-T Series User's Manual, Chapter 2: Server Installation*, available online at <https://www.supermicro.com/manuals/superserver/1U/MNL-1973.pdf>.
- *syslog-ng Store Box Appliance 4000*: see *SuperServer SYS-510P-WTR User's Manual, Chapter 2: Server Installation*, available online at <https://www.supermicro.com/manuals/superserver/1U/MNL-2266.pdf>.

The manuals are also available online at the [syslog-ng Store Box Documentation page](#). Note that SSB hardware is built to custom specifications: CPU, memory, network card, and storage options differ from the stock chassis. You can find the hardware specifications in [Hardware specifications](#).

- For details on how to install a single SSB unit, see [Installing the SSB hardware](#).
- For details on how to install two SSB units in high availability mode, see [Installing two SSB units in HA mode](#).

Installing the SSB hardware

The following section describes how to install a single syslog-ng Store Box (SSB) unit.

To install a single SSB unit

1. Unpack SSB.
2. *Optional step*: Install SSB into a rack with the slide rails. Slide rails are available for all SSB appliances.
3. Connect the cables.

a. **For general networks:**

Connect the Ethernet cable facing your LAN to the Ethernet connector labeled 1. This is the external interface of SSB. This interface is used for the initial configuration of SSB, and for communication between SSB and the clients. (For details on the roles of the different interfaces, see [Network interfaces](#).)

For 10Gbit-only networks:

Connect the cable facing your LAN to the SFP+ connector. This is the external interface of SSB, used for the initial configuration of SSB and for communication between SSB and the clients. For more information on the roles of the various interfaces, see [Network interfaces](#).

NOTE: For the list of compatible SFP+ peripherals for syslog-ng Store Box (SSB) Appliance 3500 outfitted with *Intel Ethernet Converged Network Adapter X520-DA2 NIC*, refer to the [Intel Product Compatibility Tool](#).

For the list of compatible SFP+ peripherals for syslog-ng Store Box (SSB) Appliance 3500 outfitted with *Broadcom NetXtreme-E Series P210P 2x10G PCIe NIC*, see [Supported Cables for Broadcom Ethernet Network Adapters](#) in the *Broadcom Ethernet Network Adapter User Guide*.

NOTE: For the list of compatible SFP+ peripherals for syslog-ng Store Box (SSB) Appliance 4000 outfitted with *Broadcom NetXtreme-E Series P210P 2x10G PCIe NIC*, see [Supported Cables for Broadcom Ethernet Network Adapters](#) in the *Broadcom Ethernet Network Adapter User Guide*.

CAUTION:

Do not leave any unused SFP/SFP+ transceiver in the 10Gbit interface. It may cause network outage.

- b. Connect an Ethernet cable that you can use to remotely support the SSB hardware to the IPMI interface of SSB. For details, see the following documents:

For syslog-ng Store Box (SSB) Appliance 3000, 3500 and 4000, see Knowledge Base Article [Latest IPMI firmware for Syslog-ng Store Box 3000/3500/4000 and One Identity Safeguard for Privileged Sessions 3000/3500/4000 appliances](#).

CAUTION:

Connect the IPMI before plugging in the power cord. Failing to do so will result in IPMI failure.

⚠ CAUTION: SECURITY HAZARD!

The IPMI interface, like all out-of-band management interfaces, has known vulnerabilities that One Identity cannot fix or have an effect on. To avoid security hazards, One Identity recommends that you only connect the IPMI interface to well-protected, separated management networks with restricted accessibility. Failing to do so may result in an unauthorized access to all data stored on the SSB appliance. Data on the appliance can be unencrypted or encrypted, and can include sensitive information, for example, passwords, decryption keys, private keys, and so on.

For more information, see [Best Practices for managing servers with IPMI features enabled in Datacenters](#).

NOTE: The administrator of SSB must be authorized and able to access the IPMI interface for support and troubleshooting purposes in case vendor support is needed.

The following ports are used by the IPMI interface:

- Port 623 (UDP): IPMI (cannot be changed)
 - Port 5123 (UDP): floppy (cannot be changed)
 - Port 5901 (TCP): video display (configurable)
 - Port 5900 (TCP): HID (configurable)
 - Port 5120 (TCP): CD (configurable)
 - Port 80 (TCP): HTTP (configurable)
- c. (Optional) Connect the Ethernet cable to be used for managing SSB after its initial configuration to the Ethernet connector labeled 2. This is the management interface of SSB. For more information about the different interfaces, see [Network interfaces](#).
- d. (Optional) Connect the Ethernet cable connecting SSB to another SSB node to the Ethernet connector labeled 4. This is the high availability (HA) interface of SSB. For more information about the roles of the different interfaces, see [Network interfaces](#).
4. Power on the hardware.
5. Change the BIOS password on the syslog-ng Store Box. The default password is ADMIN or changeme, depending on your hardware.
6. Change the IPMI password on the syslog-ng Store Box. The default password is ADMIN or changeme, depending on your hardware.

NOTE: Ensure that you have the latest version of IPMI firmware installed. You can download the relevant firmware from the One Identity Knowledge Base:

For syslog-ng Store Box (SSB) Appliance 3000, 3500 and 4000, see Knowledge Base Article [Latest IPMI firmware for Syslog-ng Store Box 3000/3500/4000 and One Identity Safeguard for Privileged Sessions 3000/3500/4000 appliances](#).

To change the IPMI password, connect to the IPMI remote console.

NOTE: If you encounter issues when connecting to the IPMI remote console, add the DNS name or the IP address of the IPMI interface to the allow list of the Java console. For more information, see [How can I configure the Exception Site List?](#) in the *Java documentation*.

7. Following boot, SSB attempts to receive an IP address automatically via DHCP. If it fails to obtain an automatic IP address, it starts listening for HTTPS connections on the 192.168.1.1 IP address.

To configure SSB to listen for connections on a custom IP address, complete the following steps:

- a. Access SSB from the local console, and log in with username root and password default.
- b. In the Console Menu, select **Shells > Core shell**.
- c. Change the IP address of SSB:

```
ip addr add <IP-address>/24 dev eth0
```

Replace <IP-address> with an IPv4 address suitable for your environment.

- d. Set the default gateway using the following command:

```
ip route add default via <IP-of-default-gateway>
```

Replace <IP-of-default-gateway> with the IP address of the default gateway.

- e. Type **exit**, then select **Logout** from the Console Menu.
8. Connect to the SSB web interface from a client machine and complete the Welcome Wizard as described in [The Welcome Wizard and the first login](#).

NOTE: The syslog-ng Store Box Administration Guide is available on the [syslog-ng Store Box Documentation page](#).

Installing two SSB units in HA mode

The following describes how to install SSB with high availability support.

To install SSB with high availability support

1. For the first SSB unit, complete [Installing the SSB hardware](#) on page 8.
2. For the second SSB unit, complete Steps 1-3 of [Installing the SSB hardware](#) on page 8.

3. Connect the two units with an Ethernet cable via the Ethernet connectors labeled as 4.
4. Power on the second unit.
5. Change the BIOS and IPMI passwords on the second unit. The default password is ADMIN or changeme, depending on your hardware.
6. Connect to the SSB web interface of the first unit from a client machine and enable high availability mode. Navigate to **Basic Settings** > **High Availability** . Click **Convert to Cluster**, then reload the page in your browser.
7. Click **Reboot Cluster**.
8. Wait until the slave unit synchronizes its disk to the master unit. Depending on the size of the hard disks, this may take several hours. You can increase the speed of the synchronization via the SSB web interface at **Basic Settings** > **High Availability** > **DRBD sync rate limit**.

Hardware specifications

The syslog-ng Store Box (SSB) appliances are built on high performance, energy efficient, and reliable hardware that are easily mounted into standard rack mounts.

The following sections provide detailed information of SSB appliances.

syslog-ng Store Box (SSB) Appliance 3000

Unit: 1 U

Drive Bays: 8 x 2.5

Redundant PSU: Yes

NIC:

- 2 x 1GBase-T Ethernet ports via *onboard Intel I210-AT Gigabit Ethernet Network Connection* (Intel I210 controller)
- 4 x 1GBase-T Ethernet ports via *Supermicro AOC-SGP-i4* (Intel I350 controller)

IPMI: version 2.0

CPU: Intel Xeon E3-1275 3.60 Ghz 4 Core

Memory: 2x 16GB

HDD: 4x 2TB

RAID: LSI MegaRAID SAS 9361-4i

RAID Type: RAID 5

Usable Storage: 6TB

Chassis (W x H x D): 17.2" x 1.7" x 23.5" (437 x 43 x 650 mm)

Weight: 35 lbs (15.9kg)

Wattage IDLE / LOAD: N/A

Electrical: 500W Redundant AC-DC Power Supplies

Operating Temperature: 5°C to 35°C (41°F to 95°F)

Non-operating Temperature: -40°C to 60°C (-40°F to 140°F)

Humidity Range: 8% to 90% (non-condensing)

Non-operating Humidity: 5% to 95% (non-condensing)

Compliant to: CE, cCSAus, FCC, VCCI-A

[Link to manufacturer documentation](#)

List of appliance ports

1. Redundant power supplies
2. Serial port
3. 2 x USB ports
4. 2 x USB ports
5. 2 x RJ45 GbE Ethernet ports
6. VGA port
7. 4 x 1GBase-T Ethernet ports
8. Dedicated IPMI LAN port

syslog-ng Store Box (SSB) Appliance 3500

Unit: 1 U

Drive Bays: 10 x 2.5

Redundant PSU: Yes

NIC:

- 2 x 10GBase-T Ethernet ports via *Supermicro AOC-UR-i2XT* (Intel X540 controller)
- 2 x 10G SFP+ ports via *Intel Ethernet Converged Network Adapter X520-DA2* (Intel 82599 controller)
- 2 x 1GBase-T Ethernet ports via *Intel Ethernet Server Adapter I350-T2V2* (Intel I350 controller)

or

- 2 x 10GBase-T Ethernet ports via *Supermicro AOC-URN4-B2XT* (Broadcom BCM57416 controller)
- 2 x 10G SFP+ ports via *Broadcom NetXtreme-E Series P210P 2x10G PCIe NIC* (Broadcom BCM57412 controller)
- 2 x 10GBase-T Ethernet ports via *Broadcom NetXtreme-E Series P210TP 2x10GBASE-T PCIe NIC* (Broadcom BCM57416 controller)

IPMI: version 2.0

CPU: 2 x Intel Xeon Silver 4110 2.1 Ghz 8 Core

Memory: 8 x 8GB

HDD: 8 x 2TB + 1 HotSpare

RAID:

- LSI Avago CacheVault Power Module 02 (CVPM02) Kit
- 1 x Broadcom MegaRAID SAS 9361-16i +

RAID Type: RAID 50

Usable Storage: 12 TB

Chassis (W x H x D): 17.2" x 1.7" x 28.5" (437 x 43 x 724 mm)

Weight: 41 lbs (18.6kg)

Wattage IDLE / LOAD: N/A

Electrical: 750W Redundant AC-DC Power Supplies

Operating Temperature: 10°C to 35°C (50°F ~ 95°F)

Non-operating Temperature: -40°C to 60°C (-40°F to 140°F)

Humidity Range: 8% to 90% (non-condensing)

Non-operating Humidity: 5% to 95% (non-condensing)

Compliant to: CE, cCSAus, FCC, VCCI-A

[Link to manufacturer documentation](#)

NOTE: The syslog-ng Store Box (SSB) Appliance 3500 is equipped with a dual-port 10Gbit interface. This interface has SFP+ connectors (not RJ-45) labeled 5 and 6, and can be found right of the label 1 and 2 Ethernet interfaces. If you want faster communication, for example, in case of high data load, you can connect up to two 10G SFP+ transceivers. These transceivers are not shipped with the original package and have to be purchased separately.

NOTE: For the list of compatible SFP+ peripherals for syslog-ng Store Box (SSB) Appliance 3500 outfitted with *Intel Ethernet Converged Network Adapter X520-DA2 NIC*, refer to the [Intel Product Compatibility Tool](#).

For the list of compatible SFP+ peripherals for syslog-ng Store Box (SSB) Appliance 3500 outfitted with *Broadcom NetXtreme-E Series P210P 2x10G PCIe NIC*, see [Supported Cables for Broadcom Ethernet Network Adapters](#) in the *Broadcom Ethernet Network Adapter User Guide*.

List of appliance ports

1. Redundant power supplies
2. 2 x RJ45 10GbE Ethernet ports
3. 2 x 3.0 USB ports
4. Dedicated IPMI LAN port
5. Serial port
6. VGA port
7. 2 x 1GBase-T Ethernet ports
8. 2 x SFP+ 10GbE ports

syslog-ng Store Box (SSB) Appliance 4000

Unit: 1 U

Drive Bays: 4 x 3.5

Redundant PSU: Yes

NIC:

- 2 x 10GBase-T Ethernet ports via *onboard Intel Corporation Ethernet Controller 10G X550T (rev 01)* (Intel X550 controller)
- 2 x 10G SFP+ ports via *Broadcom NetXtreme-E Series P210P 2x10G PCIe NIC* (Broadcom BCM57412 controller)
- 2 x 10GBase-T Ethernet ports via *Broadcom NetXtreme-E Series P210TP 2x10GBASE-T PCIe NIC* (Broadcom BCM57416 controller)

IPMI: version 2.0

CPU: 1 x Intel Xeon Silver ICX 4310T @ 2.30 GHz, 10C/20T

Memory: 64GB 3200Mhz ECC RDIMM RAM

HDD: 4 x Seagate Exos X20 20TB

Motherboard: [Supermicro X12SPW-TF](#)

RAID:

- Broadcom 9560-8i RAID controller
- Broadcom CacheVault battery

RAID Type: RAID 6

Usable Storage: 40 TB

Chassis (W x H x D): 17.2" x 1.7" x 28.5" (437 x 43 x 724 mm)

Weight:

- Net Weight: 24 lbs (10.89 kg)
- Gross Weight: 48 lbs (21.77 kg)

Wattage IDLE / LOAD: N/A

Electrical: Redundant 500W 80 Plus, Platinum 110 - 240V

Operating Temperature: 10°C to 35°C (50°F ~ 95°F)

Non-operating Temperature: -40°C to 70°C (-40°F to 158°F)

Humidity Range: 8% to 90% (non-condensing)

Non-operating Humidity: 5% to 95% (non-condensing)

[Link to manufacturer documentation](#)

NOTE: The syslog-ng Store Box (SSB) Appliance 4000 is equipped with a dual-port 10Gbit SFP+ interface (numbered 8 on the photo of the backplate), where you can connect up to two 10G SFP+ transceivers. These transceivers are not shipped with the original package and must be purchased separately.

NOTE: For the list of compatible SFP+ peripherals for syslog-ng Store Box (SSB) Appliance 4000 outfitted with *Broadcom NetXtreme-E Series P210P 2x10G PCIe NIC*, see [Supported Cables for Broadcom Ethernet Network Adapters](#) in the *Broadcom Ethernet Network Adapter User Guide*.

List of appliance ports

1. Redundant Platinum 500W Power Supply
2. 1 x Serial port
3. 1 x Dedicated IPMI LAN port
4. 2 x USB ports
5. 2 x USB 3.2 Gen 1 ports
6. 2 x RJ45 10GbE LAN ports
7. 1 x VGA port
8. 2 x 10GB SFP+ NIC
9. 2 x 10GB RJ45 NIC

syslog-ng Store Box Software Installation Guide

This section describes how to install the syslog-ng Store Box (SSB) software on a certified hardware.

Note that installing and reinstalling SSB can take a long time, especially for a HA cluster. There are no supported workarounds for reducing the necessary downtime. One Identity recommends testing SSB in a virtual environment, and using physical hardware only for verifying HA functionality and measuring performance.

Installing the SSB software

This section describes how to install a new SSB on a server.

To install a new SSB on a server

1. Log in to your [support portal](#) account and download the latest syslog-ng Store Box installation ISO file.

NOTE: You must have partner access to download syslog-ng Store Box ISO files. If you are a partner but do not see the ISO files, request partner access in the [support portal](#).

2. Mount the ISO image, or burn it to a CD-ROM.
3. Connect your computer to the IPMI interface of SSB. For details, see the following documents:

For syslog-ng Store Box (SSB) Appliance 3000, 3500 and 4000, see Knowledge Base Article [Latest IPMI firmware for Syslog-ng Store Box 3000/3500/4000 and One Identity Safeguard for Privileged Sessions 3000/3500/4000 appliances](#).

4. Power on the server.
5. Log in to the IPMI web interface, and boot the syslog-ng Store Box installation media on the server using a virtual drive. For more information, see:

For syslog-ng Store Box (SSB) Appliance 3000, 3500 and 4000, see Knowledge Base Article [Latest IPMI firmware for Syslog-ng Store Box 3000/3500/4000 and One Identity Safeguard for Privileged Sessions 3000/3500/4000 appliances](#).

6. When the syslog-ng Store Box installer starts, select **Installer**, press **Enter**, and wait until the server finishes the boot process.
7. Select **Install a new SSB** and press **Enter** to start the installation process. Depending on the size of the disks, the installation process takes from a few minutes to an hour to complete. The progress of the installation is indicated in the **Installation Steps** window.
8. If the installer shows **Warning, all data on the hard drive(s) will be erased. Are you sure?**, select **Yes** and press **Enter**.
9. When the installer shows the MAC addresses of the network interfaces found in the SSB, take note of the addresses.
10. The installer displays the product name (the SSB configuration that was installed). If the product name displayed does not match the product you wanted to install, complete the following steps:
 - a. Check that the hardware configuration of the appliance matches the specifications provided by One Identity.
 - b. If the configuration matches the specifications, but the installer displays a different product name, [contact our Support Team](#).
11. During the **Finishing the Setup** step, the installer performs RAID synchronization.
 - Select **Yes** to perform the RAID synchronization. RAID synchronization is a two-step process, the progress of the active step is indicated on the progress bar. Wait until both steps are completed.

NOTE: RAID synchronization may take several hours (about 8 hours on average).
 - Select **No** to skip the RAID synchronization.

NOTE: If you skip RAID synchronization, the system will automatically perform synchronization after the first boot. However, the process will take several days.
12. After the installation is finished, return to the main menu by pressing **Enter**.
13. To restart the system, select **Reboot** and press **Enter**. Wait until the system reboots.
14. Connect your computer to the EXT interface of SSB. Create an alias IP address for your computer that falls into the 192.168.1.0/24 subnet (for example, 192.168.1.10). For details, see [The initial connection to SSB](#).
15. Open the <http://192.168.1.1> URL in your web browser and verify that the Welcome Wizard of the syslog-ng Store Box is available.

NOTE: For details on the supported web browsers and operating systems, see [Supported web browsers](#).

syslog-ng Store Box VMware Installation Guide

This tutorial describes the possibilities and limitations of installing syslog-ng Store Box (SSB) 7.4.0 as a virtual appliance under a VMware ESXi server.

Limitations of SSB under VMware

The following limitations apply to running version 7.4.0 of SSB under VMware:

- SSB can be installed under the following VMware versions:
 - VMware ESXi 4.0 or later.
 - VMware ESX 4.0 or later.
- SSB supports both thin and thick provisioning but can only use fixed disk space assigned to the virtual host. To increase the virtual disk size, you must power down SSB, as it does not support on-the-fly disk allocation scenarios. To increase the size of the virtual disk, see [Increasing the virtual disk size of SSB under a virtual machine](#).
- Hardware-related alerts and status indicators of SSB may display inaccurate information, for example, display degraded RAID status.
- Creating Quiesced snapshots is not supported. Disable this option when taking a snapshot of your SSB appliance, otherwise the boot firmware of the appliance becomes tainted.

Installing SSB under VMware ESXi/ESX

The following procedure describes how to install a new SSB under VMware ESXi or ESX.

To install a new SSB under VMware ESXi or ESX

1. Create the virtual machine for SSB using the following settings:
 - Guest operating system: *Linux/Ubuntu 64-bit*.
 - Allocate memory for the virtual machine. SSB requires a minimum of 1 GB of memory, in addition to the memory limit of the indexed logspaces. The recommended size for the memory depends on the exact environment, but consider the following:
 - The base system requires 256 MB.
 - The syslog-ng server running on SSB requires between 128 MB and 1 GB of memory, depending on the message load and on the configuration of SSB.
 - For every logspace, SSB requires additional memory to index the incoming messages. The amount of memory allocated for the indexer can be set individually for every logspace.
 - The hard disk controller must be *LSI Logic Parallel*.
 - Do not use RAID for the hard disk, use the data duplication features of your virtual environment instead. That way, a single hard disk is sufficient for the system. If you need to use the built-in RAID support of SSB for some reason, use two hard disks, and SSB will automatically use them in software RAID.

⚠ CAUTION:
Hazard of data loss When you install or reinstall SSB in a virtual environment, always create new hard disks. Using existing hard disks can cause unexpected behavior and operational problems.

 - Configure a fixed size disk with at least 8 GB space.

About 5 GB is required for the base system, the remaining disk space is used to store data. To increase the initial disk size, see [Increasing the virtual disk size of SSB under a virtual machine](#).
 - SSB requires that you use either 1 network card or 4 network cards, all of them must be VMXNET3.

NOTE: In case of establishing a High Availability cluster, four network cards must be configured as described in section [With or without High Availability cluster capability](#).
2. After creating the virtual machine, edit the settings of the machine. Set the following options:
 - a. Under **Options > VMware Tools**, enable the **Shutdown, Suspend, Reset** options, otherwise the SSB administrator will not be able to access these functions from the SSB web interface.
 - b. Under **Options > Boot options**, enable the **Force BIOS Setup** option. This is required to be able to check the system time (and modify it if needed) before installing SSB.

3. Log in to the [support portal](#) and download the latest syslog-ng Store Box installation ISO file. Note that you need to have purchased SSB as a virtual appliance or have partner access to download syslog-ng Store Box ISO files. If you are a partner but do not see the ISO files, you can request partner access within the [support portal](#).
4. Mount the ISO image and boot the virtual machine. Follow the on-screen instructions to install SSB.

Once installation successfully completes, the virtual machine will restart automatically.

If installation fails, a message appears to press **Ctrl + Alt + Delete** to reboot the virtual machine.

With or without High Availability cluster capability

From version 7.3.0, two virtual SSB appliances can be connected into a High Availability (HA) cluster. To do so, make sure that the following requirements are met:

1. The disks must be exactly of the same type and same size in both of the involved SSB appliances. Only one disk can be used, and no external data disks are allowed.
2. Both virtual machines must have four virtual network interfaces. The same requirement applies for the hardware-based SSB appliances as well. The involved interfaces will be automatically renamed to eth0, eth1, eth2, and eth3.

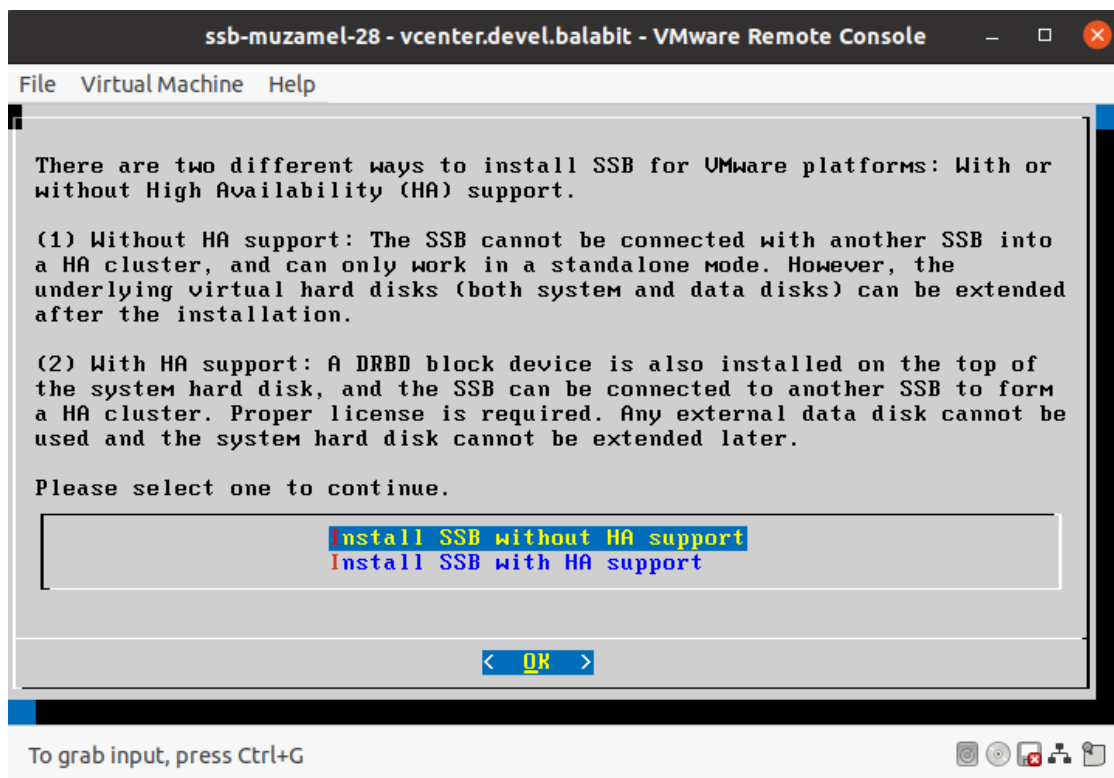

However, if you plan to use the "Redundant HA" or "Next-hop Monitoring" features, you must configure the first three virtual network interfaces to promiscuous mode, so that SSB can pass each incoming packet to the CPU and enable MacVlan interfaces inside the virtual interfaces.

To configure a promiscuous subnet inside VMware execute the following steps:

- a. Under the **Networking** tab, select the appropriate subnet.
The subnet information will appear on the right panel.
- b. Select the **Configure** tab, then navigate to **Settings > Policies**.
- c. Under the **Security** section, set the **Promiscuous mode** to **Accept** by clicking **Edit**.

Make sure that the fourth interface (eth3) is set up with a port group. Configure the same port group on both virtual machines. This emulates the two machines being connected with a cable.

3. Install DRBD block devices on the core firmware disk partition. During installation, a selector pop-up page appears to choose between "HA support" or "No HA Support" (standalone) mode as shown in the following screenshot:

4. Make sure that similarly to hardware-based HA, an HA-enabled license is available.

If you meet all requirements for both SSB virtual machines, you can connect them into an HA cluster. However, consider the following limitations of virtual HA installations compared to virtual standalone installations:

- You cannot extend the virtual disk size after installation. In other words, the "Disk Resize" feature is not available for virtual SSB appliances.
- SSB can collect logs only on the system disk. You cannot configure or use external data disks.

Upgraded versions of SSB also have these limitations.

syslog-ng Store Box Hyper-V Installation Guide

This tutorial describes the possibilities and limitations of installing syslog-ng Store Box (SSB) 7.4.0 as a virtual appliance under a Hyper-V server.

Limitations of SSB under Hyper-V

Version 7.4.0 of SSB has no special support for running under Hyper-V. While the basic functionality of SSB is not affected by running as a virtual appliance, the following limitations apply:

- If High Availability (HA) operation mode is required in a virtual environment, use the HA function provided by the virtual environment.
- Hardware-related alerts and status indicators of SSB may display inaccurate information, for example, display degraded RAID status.
- When running SSB under Microsoft Hyper-V, ensure that the network interfaces are actually connected to the network. When running under Hyper-V, SSB indicates on the **Basic Settings > Network > Ethernet links** page that there is a link, even if the network interface is configured and enabled, but not connected to the network.
- When rebooting SSB in Hyper-V, the following critical error message may appear in the event log of the Hyper-V host:

```
<Virtual machine name> was reset because an unrecoverable error occurred on a virtual processor that caused a triple fault.
```

This is normal, there is no problem with SSB. For details, see [Triple fault in event log shows reset of Linux virtual machines](#).

Installing SSB under Hyper-V

The following describes how to install a new SSB under Hyper-V.

To install a new SSB under Hyper-V

1. Create the virtual machine for SSB using the following settings:
 - Choose **Generation 1** for the virtual machine.
 - Allocate memory for the virtual machine. SSB requires a minimum of 1 GB of memory, in addition to the memory limit of the indexed logspaces. The recommended size for the memory depends on the exact environment, but consider the following:
 - The base system requires 256 MB.
 - The syslog-ng server running on SSB requires between 128 MB and 1 GB of memory, depending on the message load and on the configuration of SSB.
 - For every logspace, SSB requires additional memory to index the incoming messages. The amount of memory allocated for the indexer can be set individually for every logspace.
 - Configure a fixed size disk with at least 8 GB space.

About 5 GB is required for the base system, the remaining disk space is used to store data.
 - Do not use RAID for the hard disk, use the data duplication features of your virtual environment instead. That way, a single hard disk is sufficient for the system. If you need to use the built-in RAID support of SSB for some reason, use two hard disks, and SSB will automatically use them in software RAID.
- ⚠ CAUTION:**
- Hazard of data loss** When you install or reinstall SSB in a virtual environment, always create new hard disks. Using existing hard disks can cause unexpected behavior and operational problems.
- SSB requires that you use either 1 network card or 4 network cards. If you wish to use more than one network card, then after completing the steps of the **New Virtual Machine Wizard**, add the additional network cards in the **Settings** of the virtual machine.

**CAUTION:**

Hyper-V offers two types of virtual Network Adapters (NICs): Legacy and Synthetic. Due to a known issue (Hyper-V network adapters are mapped to a different eth on every boot), using Legacy and Synthetic NICs within the same configuration will result in an incorrect network configuration. Because of this, if you must use more than one NIC, One Identity recommends using only Legacy NICs.

2. Log in to your [support portal](#) account and download the latest syslog-ng Store Box installation ISO file.

NOTE: You can download ISO files only if you purchased SSB as a virtual appliance or have partner access. If you are a partner but do not see the ISO files, request partner access within the [support portal](#).

3. Mount the ISO image and boot the virtual machine. Follow the on-screen instructions to install SSB.

Once installation successfully completes, the virtual machine will restart automatically.

In case installation fails, a message will be displayed instructing you to press **Ctrl+Alt+Delete** to reboot the virtual machine.

Increasing the virtual disk size of SSB under a virtual machine

Increasing the virtual disk size of SSB version 4.9 or later under a virtual machine

SSB can only use fixed disk space assigned to the virtual host. If you must increase the size of the virtual disk, complete the following steps.

Prerequisites

Before starting the procedure, make sure that the following prerequisites are met:

- The machine that SSB is running on must be a virtual machine. This procedure will not work on a physical machine.
- The version running on the virtual machine must be a newly installed SSB 4.9 or later version. This procedure will not work if the SSB installation was upgraded from an earlier version.
- No software RAID must be configured.

To increase the size of the virtual disk

1. To ensure that no data is lost in case of an error, create a full system backup (configuration and data backup). For more information, see [Data and configuration backups](#).
2. Power down the virtual machine.
3. Increase the storage size.
4. Restart SSB.

If you have encountered any errors, [contact our Support Team](#).

NOTE: Depending on the original size of the virtual disk and on the size you will expand it to, starting the virtual machine for your SSB device after you expanded the size of your virtual disk may take a long time.

One Identity solutions eliminate the complexities and time-consuming processes often required to govern identities, manage privileged accounts and control access. Our solutions enhance business agility while addressing your IAM challenges with on-premises, cloud and hybrid environments.

For sales and other inquiries, such as licensing, support, and renewals, visit <https://www.oneidentity.com/company/contact-us.aspx>.

Technical support resources

Technical support is available to One Identity customers with a valid maintenance contract and customers who have trial versions. You can access the Support Portal at <https://support.oneidentity.com/>.

The Support Portal provides self-help tools you can use to solve problems quickly and independently, 24 hours a day, 365 days a year. The Support Portal enables you to:

- Submit and manage a Service Request
- View Knowledge Base articles
- Sign up for product notifications
- Download software and technical documentation
- View how-to videos at www.YouTube.com/OneIdentity
- Engage in community discussions
- Chat with support engineers online
- View services to assist you with your product
